

## AC'97 Audio + Touchpanel CODEC

### DESCRIPTION

The WM9713L is a highly integrated input/output device designed for mobile computing and communications.

The chip is architected for dual CODEC operation, supporting Hi-Fi stereo Codec functions via the AC link interface, and additionally supporting voice Codec functions via a PCM type Synchronous Serial Port (SSP). A third Aux DAC is provided which may be used to support generation of supervisory tones, or ring-tones etc. at different sample rates to the main codec.

The device can connect directly to a 4-wire or 5-wire touch-panel, mono or stereo microphones, stereo headphones and a stereo speaker, reducing total component count in the system. Cap-less connections to the headphones, speakers, and earpiece may be used, saving cost and board area. Additionally, multiple analog input and output pins are provided for seamless integration with analog connected wireless communication devices.

All device functions are accessed and controlled through a single AC-Link interface compliant with the AC'97 standard. The 24.576 MHz masterclock can be input directly or generated internally from a 13MHz (or other frequency) clock by an onboard PLL. The PLL supports a wide range of input clock from 2.048Mhz to 78.6Mhz.

The WM9713L operates at supply voltages from 1.8 to 3.6 Volts. Each section of the chip can be powered down under software control to save power. The device is available in a small leadless 7x7mm QFN package, ideal for use in handheld portable systems.

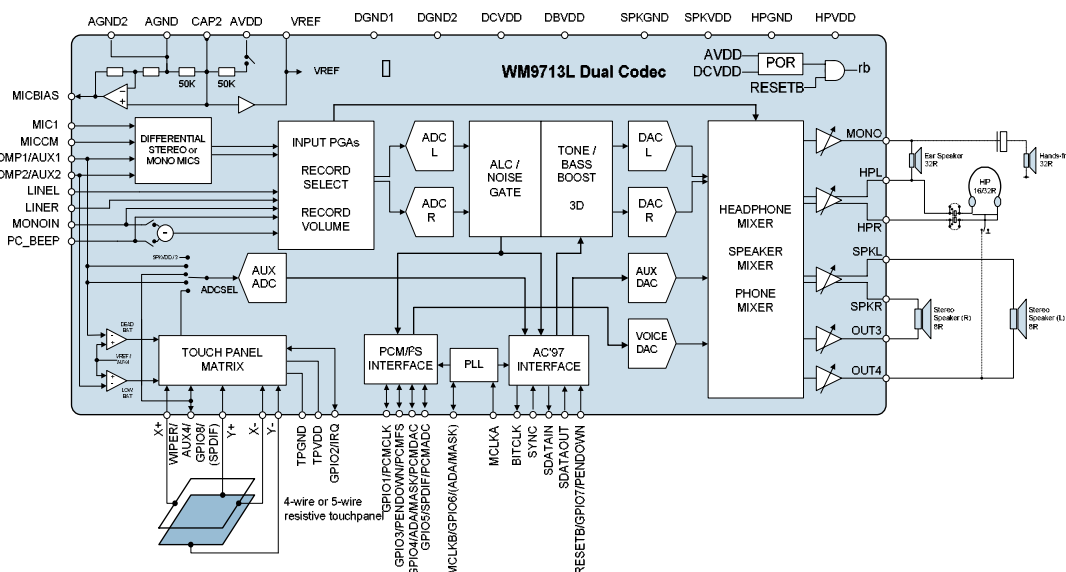

### FEATURES

- AC'97 Rev 2.2 compatible stereo codec
  - DAC SNR 94dB, THD -85dB
  - ADC SNR 87dB, THD -86dB
  - Variable Rate Audio, supports all WinCE sample rates
  - Tone Control, Bass Boost and 3D Enhancement
- On-chip 45mW headphone driver
- On-chip 400mW mono or stereo speaker drivers
- Stereo, mono or differential microphone input
  - Automatic Level Control (ALC)
  - Mic insert and mic button press detection
- Auxiliary mono DAC (ring tone or DC level generation)
- Seamless interface to wireless chipset
- Resistive touchpanel interface
  - Supports 4-wire and 5-wire panels
  - 12-bit resolution, INL  $\pm 2$  LSBs (<0.5 pixels)
  - X, Y and touch-pressure (Z) measurement
  - Pen-down detection supported in Sleep Mode
- Additional PCM/I<sup>2</sup>S interface to support voice CODEC
- PLL derived audio clocks.
- Supports input clock ranging from 2.048Mhz to 78.6Mhz
- 1.8V to 3.6V supplies (digital down to 1.62V, speaker up to 4.2V)
- 7x7mm 48-pin QFN package

### APPLICATIONS

- Personal Digital Assistants (PDA) with or without phone
- Smartphones
- Handheld and Tablet Computers

## PIN CONFIGURATION

## ORDERING INFORMATION

DEVICE	TEMPERATURE RANGE	PACKAGE	MOISTURE SENSITIVITY LEVEL	PEAK SOLDERING TEMPERATURE
WM9713LGEFL/V	-25 to +85°C	48-pin QFN (lead free)	MSL3	260°C
WM9713LGEFL/RV	-25 to +85°C	48-pin QFN (lead free, tape and reel)	MSL3	260°C

**Note:**

Reel quantity = 2,200

## PIN DESCRIPTION

PIN	NAME	TYPE	DESCRIPTION
1	DBVDD	Supply	Digital I/O Buffer Supply
2	MCLKA	Digital Input	Master Clock A Input
3	MCLKB / GPIO6 / (ADA / MASK)	Digital In/Out	Master Clock B Input / GPIO6 / (ADA output / MASK input)
4	DGND1	Supply	Digital Ground (return path for both DCVDD and DBVDD)
5	SDATAOUT	Digital Input	Serial Data Output from Controller / Input to WM9713L
6	BITCLK	Digital Output	Serial Interface Clock Output to Controller
7	DGND2	Supply	Digital Ground (return path for both DCVDD and DBVDD)
8	SDATAIN	Digital Output	Serial Data Input to Controller / Output from WM9713L
9	DCVDD	Supply	Digital Core Supply
10	SYNC	Digital Input	Serial Interface Synchronisation Pulse from Controller
11	RESETB / GPIO7 / (PENDOWN)	Digital In / Out	Reset (asynchronous, active Low, resets all registers to their default) / GPIO7 / (pen down output)
12	WIPER / AUX4 / GPIO8 / (SPDIF)	Analogue In / Out	Top Sheet Connection for 5-wire Touchpanels / Auxiliary ADC input / GPIO8 / (SPDIF digital audio output)
13	TPVDD	Supply	Touchpanel Driver Supply
14	X+/ BR	Analogue Input	Touchpanel Connection: X+ (Right) for 4-wire / bottom right for 5-wire
15	Y+/TR	Analogue Input	Touchpanel Connection: Y+ (Top) for 4-wire / top right for 5-wire
16	X-/TL	Analogue Input	Touchpanel Connection: X- (Left) for 4-wire / top left for 5-wire
17	Y-/BL	Analogue Input	Touchpanel Connection: Y- (Bottom) for 4-wire / bottom left for 5-wire
18	TPGND	Supply	Touchpanel Driver Ground
19	PCBEEP	Analogue Input	Line Input to analogue audio mixers, typically used for beeps
20	MONOIN	Analogue Input	Mono Input (RX)
21	MIC1	Analogue Input	Microphone preamp A input 1
22	MICCM	Analogue Input	Microphone common mode input
23	LINEL	Analogue Input	Left Line Input
24	LINER	Analogue Input	Right Line Input
25	AVDD	Supply	Analogue Supply (audio DACs, ADCs, PGAs, mic amps, mixers)
26	AGND	Supply	Analogue Ground
27	VREF	Analogue Output	Internal Reference Voltage (buffered CAP2)
28	MICBIAS	Analogue Output	Bias Voltage for Microphones (buffered CAP2 $\times$ 1.8)
29	MIC2A / COMP1 / AUX1	Analogue Input	Microphone preamp A input 2 / COMP1 input / Auxillary ADC input
30	MIC2B / COMP2 / AUX2	Analogue Input	Microphone preamp B input / COMP2 input / Auxillary ADC input
31	MONO	Analog output	Mono output driver (line or headphone)
32	CAP2	Analogue In / Out	Internal Reference Voltage (normally AVDD/2, if not overdriven)
33	OUT4	Analogue Output	Auxillary output driver (speaker, line or headphone)
34	SPKGND	Supply	Speaker ground (feeds output buffers on pins 33, 35, 36 and 37)
35	SPKL	Analogue Output	Left speaker driver (speaker, line or headphone)
36	SPKR	Analogue Output	Right speaker driver (speaker, line or headphone)
37	OUT3	Analogue Output	Auxillary output driver (speaker, line or headphone)
38	SPKVDD	Supply	Speaker supply (feeds output buffers on pins 33, 35, 36 and 37)
39	HPL	Analogue Output	Headphone left driver (line or headphone)
40	HPGND	Supply	Headphone ground (feeds output buffers on pins 39 and 41)
41	HPR	Analogue Output	Headphone right driver (line or headphone)
42	AGND2	Supply	Analogue ground, chip substrate
43	HPVDD	Supply	Headphone supply (feeds output buffers on pins 39 and 41)

**WM9713L**

Preliminary Technical Data

<b>PIN</b>	<b>NAME</b>	<b>TYPE</b>	<b>DESCRIPTION</b>
44	GPIO1 / PCMCLK	Digital In / Out	GPIO Pin 1 or PCM interface clock
45	GPIO2 / IRQ	Digital In / Out	GPIO Pin 2 or IRQ (Interrupt Request) output
46	GPIO3 / PENDOWN / PCMFS	Digital In / Out	GPIO Pin 3 or pen down output or PCM frame signal
47	GPIO4 / ADA / MASK / PCMDAC	Digital In / Out	GPIO Pin 4 or ADA (ADC data available) output or Mask input or PCM input (DAC) data
48	GPIO5 / SPDIF / PCMADC	Digital In / Out	GPIO Pin 5 or SPDIF digital audio output or PCM output (ADC) data

## ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified.

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

Wolfson tests its package types according to IPC/JEDEC J-STD-020B for Moisture Sensitivity to determine acceptable storage conditions prior to surface mount assembly. These levels are:

MSL1 = unlimited floor life at <30°C / 85% Relative Humidity. Not normally stored in moisture barrier bag.

MSL2 = out of bag storage for 1 year at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

MSL3 = out of bag storage for 168 hours at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

The Moisture Sensitivity Level for each package type is specified in Ordering Information.

CONDITION	MIN	MAX
Digital supply voltages (DCVDD, DBVDD)	-0.3V	+3.63V
Analogue supply voltages (AVDD, HPVDD, TPVDD)	-0.3V	+3.63V
Speaker supply voltage (SPKVDD)	-0.3V	+4.2V
Touchpanel supply voltage (TPVDD)		AVDD +0.3V
Voltage range digital inputs	DGND -0.3V	DBVDD +0.3V
Voltage range analogue inputs	AGND -0.3V	AVDD +0.3V
Voltage range touchpanel Inputs X+, X-, Y+ and Y-		TPVDD +0.3V
Voltage range touchpanel Inputs X+, X-, Y+ and Y-		AVDD +0.3V
Operating temperature range, T <sub>A</sub>	-25°C	+85°C
Storage temperature (TQFP package only)	-65°C	+150°C

## RECOMMENDED OPERATING CONDITIONS

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital input/output buffer supply range	DBVDD		1.62 (target)	3.3	3.6	V
Digital core supply range	DCVDD		1.62 (target)	1.8	3.6	V
Analogue supply range	AVDD, HPVDD, TPVDD		1.8	3.3	3.6	V
Speaker supply range	SPKVDD		1.8	3.3	4.2	V
Digital ground	DGND1, DGND2			0		V
Analogue ground	AGND, HPGND, SPKGND, TPGND			0		V
Difference AGND to DGND		Note 1	-0.3	0	+0.3	V

**Note:**

1. AGND is normally the same as DGND1/DGND2
2. DCVDD ≤ DBVDD and DCVDD ≤ AVDD

## ELECTRICAL CHARACTERISTICS

## AUDIO OUTPUTS

## Test Conditions

DBVDD=3.3V, DCVDD = 3.3V, AVDD=HPVDD=SPKVDD =3.3V,  $T_A = +25^{\circ}\text{C}$ , 1kHz signal,  $f_s = 48\text{kHz}$ , 24-bit audio data unless otherwise stated.

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>DAC to Line-Out (HPL/R or MONO with 10k<math>\Omega</math> / 50pF load)</b>						
Full-scale output		AVDD = 3.3V, PGA gains set to 0dB		1		V rms
Signal to Noise Ratio (A-weighted)	SNR		85	94		dB
Total Harmonic Distortion	THD	-3dB output		-85	-74	dB
Power Supply Rejection	PSRR	100mV, 20Hz to 20kHz signal on AVDD		50		dB
<b>Speaker Output (SPKL/SPKR with 8<math>\Omega</math> bridge tied load, INV=1)</b>						
Output Power at 1% THD	$P_O$	THD = 1%		400		mW (rms)
Abs. max output power	$P_{Omax}$			500		mW (rms)
Total Harmonic Distortion	THD	$P_O = 200\text{mW}$		-66 0.05		dB %
Signal to Noise Ratio (A-weighted)	SNR			90		dB
<b>Stereo Speaker Output (SPKL/OUT4 and SPKR/OUT3 with 8<math>\Omega</math> bridge tied load, INV=1)</b>						
Output Power at 1% THD	$P_O$	THD = 1%		400		mW (rms)
Abs. max output power	$P_{Omax}$			500		mW (rms)
Total Harmonic Distortion	THD	$P_O = 200\text{mW}$		-66 0.05		dB %
Signal to Noise Ratio (A-weighted)	SNR			90		dB
<b>Headphone Output (HPL/R, OUT3/4 or SPKL/SPKR with 16<math>\Omega</math> or 32<math>\Omega</math> load)</b>						
Output Power per channel	$P_O$	Output power is very closely correlated with THD; see below.				
Total Harmonic Distortion	THD	$P_O=10\text{mW}$ , $R_L=16\Omega$		-80		dB
		$P_O=10\text{mW}$ , $R_L=32\Omega$		-80		
		$P_O=20\text{mW}$ , $R_L=16\Omega$		-78		
		$P_O=20\text{mW}$ , $R_L=32\Omega$		-79		
Signal to Noise Ratio (A-weighted)	SNR			90		dB

## Note:

- All THD values are valid for the output power level quoted above – for example, at HPVDD=3.3V and  $R_L=16\Omega$ , THD is -80dB when output power is 10mW. Higher output power is possible, but will result in a deterioration in THD.

**AUDIO INPUTS****Test Conditions**

DBVDD=3.3V, DCVDD = 3.3V, AVDD = 3.3V, T<sub>A</sub> = +25°C, 1kHz signal, fs = 48kHz, 24-bit audio data unless otherwise stated.

1. All audio and non-audio sample rates and other timing scales proportionately with the master clock.
2. For signal timing on the AC-Link, please refer to the AC'97 specification (Revision 2.2)

## HEADPHONE / SPEAKER OUTPUT THD VERSUS POWER

## **POWER CONSUMPTION**

**TBA**

## DEVICE DESCRIPTION

### INTRODUCTION

The WM9713L is a largely pin compatible upgrade to WM9712, with a PCM voice codec added. This codec is interfaced via a PCM type audio interface which makes use of GPIO pins for connection.

It is designed to meet the mixed-signal requirements of portable and wireless smartphone systems. It includes audio recording and playback, touchpanel digitisation, battery monitoring, auxiliary ADC and GPIO functions, all controlled through a single 5-wire AC-Link interface. Additionally, PCM voice codec functions are supported through provision of an additional voice DAC and a PCM audio serial interface.

A PLL is included to allow unrelated reference clocks to be used for generation of the AC link system clock. Typically 13MHz or 2.048MHz references might be used as a reference.

### SOFTWARE SUPPORT

The basic audio features of the WM9713L are software compatible with standard AC'97 device drivers. However, to better support the touchpanel and other additional functions, Wolfson Microelectronics supplies custom device drivers for selected CPUs and operating systems. Please contact your local Wolfson Sales Office for more information.

### AC'97 COMPATIBILITY

The WM9713L uses an AC'97 interface to communicate with a microprocessor or controller. The audio and GPIO functions are largely compliant with AC'97 Revision 2.2. The following **differences** from the AC'97 standard are noted:

- Pinout: The function of some pins has been changed to support device specific features. The PHONE and PCBEEP pins have been moved to different locations on the device package.
- Package: The default package for the WM9713L is a 7×7mm leadless QFN package.
- Audio mixing: The WM9713L handles all the audio functions of a smartphone, including audio playback, voice recording, phone calls, phone call recording, ring tones, as well as simultaneous use of these features. The AC'97 mixer architecture does not fully support this. The WM9713L therefore uses a modified AC'97 mixer architecture with three separate mixers.
- Tone Control, Bass Boost and 3D Enhancement: These functions are implemented in the digital domain and therefore affect only signals being played through the audio DACs, not all output signals as stipulated in AC'97.

Some other functions are **additional** to AC'97:

- On-chip BTL loudspeaker driver for mono or stereo speakers
- On-chip BTL driver for ear speaker (phone receiver)
- Auxiliary mono DAC for ring tones, system alerts etc.
- Touchpanel controller
- Auxiliary ADC Inputs
- 2 Analogue Comparators for Battery Alarm
- Programmable Filter Characteristics for Tone Control and 3D Enhancement
- PCM interface to additional Voice DAC and existing audio ADCs
- PLL to create AC'97 system clock from unrelated reference clock input

**PCM CODEC**

The PCM voice codec functions typically required by mobile telephony devices are provided by an extra voice DAC on the WM9713L, which is interfaced via a standard PCM type data interface, which is constructed through optional use of 4 of the GPIO pins on WM9713L. The audio output data from one or both of the audio ADCs can also be output over this PCM interface, allowing a full voice codec function to be implemented. This codec supports sample rates from 8 to 48ks/s using the standard AC'97 masterclock, with the WM9713L PCM interface always acting as a master.

## AUDIO PATHS OVERVIEW

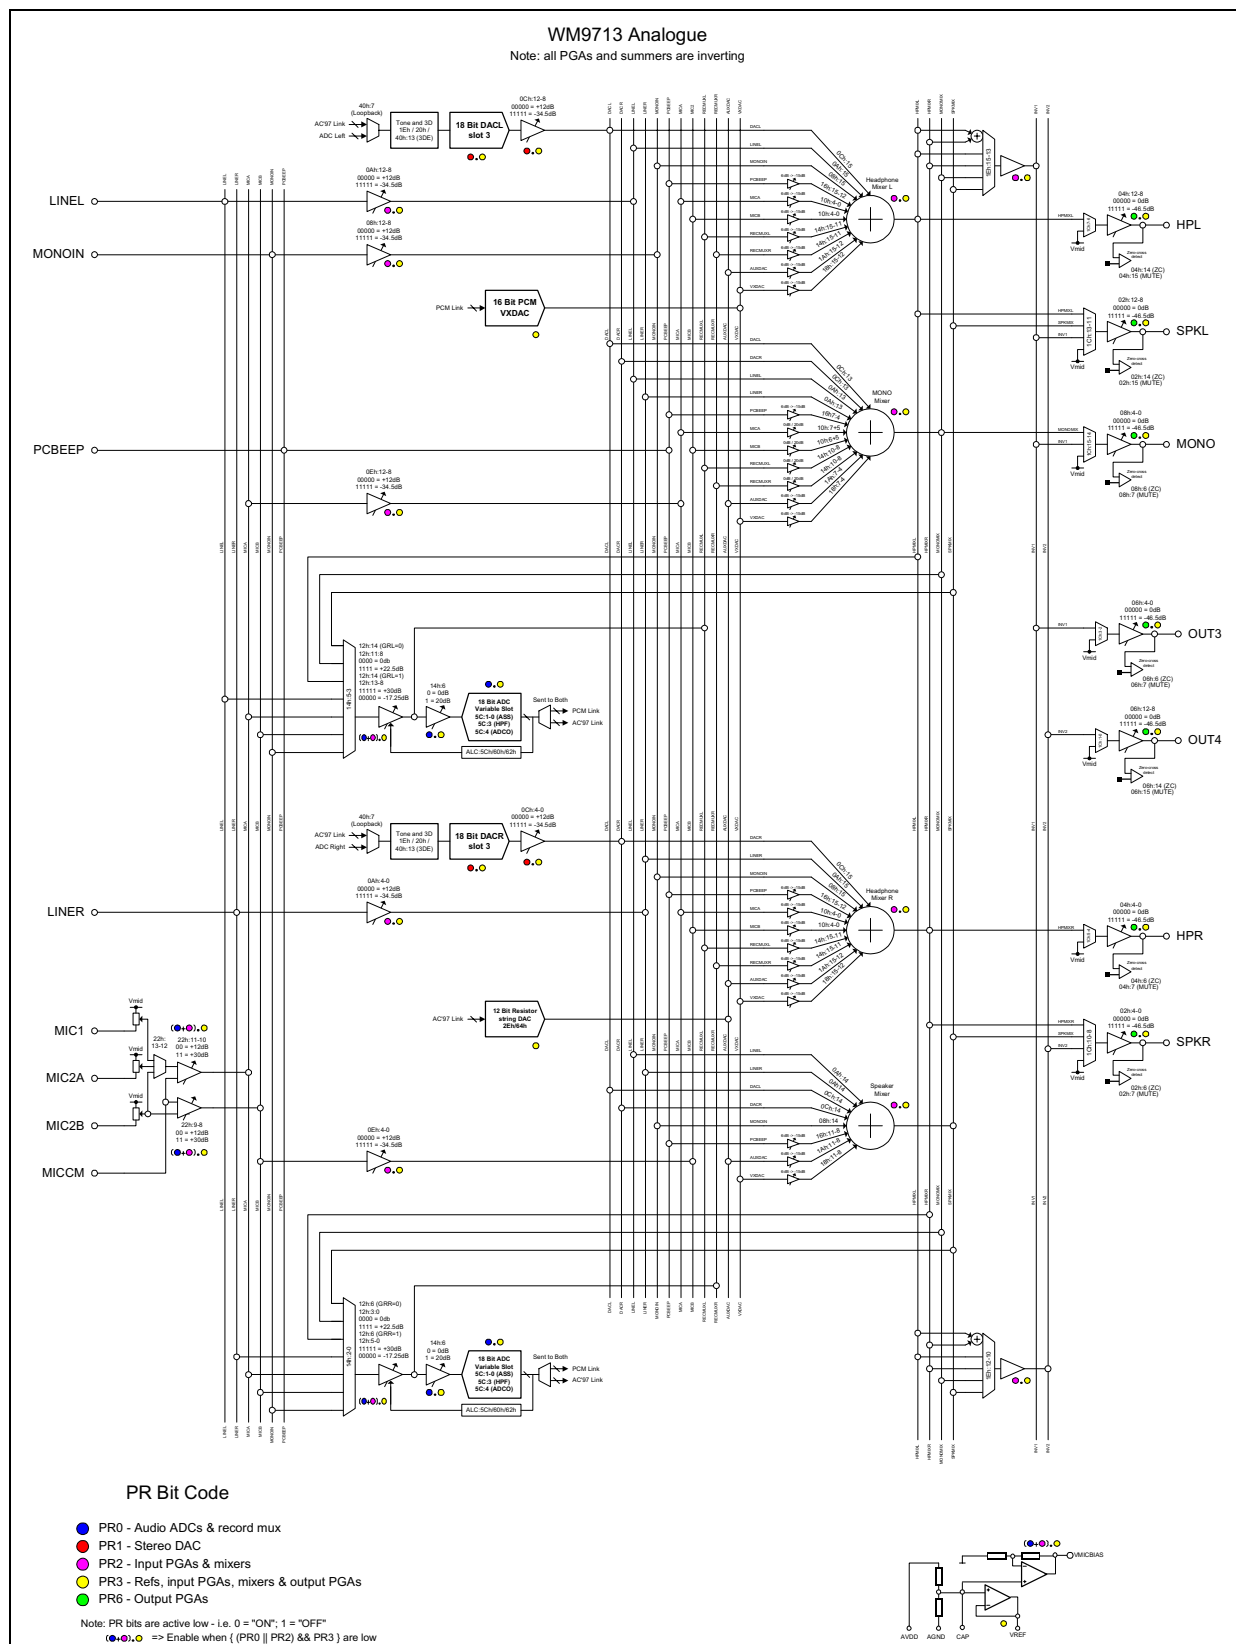

Figure 1 Audio Paths Overview

## CLOCK GENERATION

WM9713L supports clocking from 2 separate sources, which can be selected via the AC'97 interface:

- External clock input MCLKA
- External clock input MCLKB

The source clock is divided to appropriate frequencies in order to run the AC'97 interface, PCM interface, voice DAC and Hi-fi DSP by means of a programmable divider block. Clock rates may be changed during operation via the AC'97 link in order support alternative modes, for example low power mode when voice data is being transmitted only. A PLL is present to add flexibility in selection of input clock frequencies, typical choices being 2.048MHz, 4.096MHz or 13MHz.

Default mode on power-up assumes a clock will be present on MCLKA with the PLL powered down. This enables data to be clocked via the AC'97 link to define the desired clock divider mode and whether PLL needs to be activated.

**Note:** This clock can be any available frequency.

When muxing between MCLKA and MCLKB both clocks must be active for at least two clock cycles after the switching event.

## CLOCK DIVISION MODES

Figure 2 shows the clocking strategy for WM9713L. Clocking is controlled by CLK\_MUX, CLK\_SRC and S[6:0].

- CLKAX2, CLKBX2 – clock doublers on inputs MCLKA and MCLKB.
- CLK\_MUX - selects between MCLKA and MCLKB.
- CLK\_SRC – selects between external or PLL derived clock reference.
- S[3:0] – sets the voice DAC clock rate and PCM interface clock when in master mode (division ratio 1 to 16 available).
- S[6:4] - sets the hi-fi clocking rate (division ratio 1 to 8 available).

The registers used to set these switches can be accessed from register address 44h (see Table 1).

If a mode change requires switching from an external clock to a PLL generated clock then it is recommended to set the clock division ratios required for the PLL clock scheme prior to switching between clocks. This option is accommodated by means of two sets of registers S<sub>PLL</sub>[6:0] and S<sub>EXT</sub>[6:0]. If the PLL is selected (CLK\_SRC = 0) S[6:0] = S<sub>PLL</sub>[6:0], if an external clock is selected (CLK\_SRC = 1) S[6:0] = S<sub>EXT</sub>[6:0]. S<sub>EXT</sub>[6:0] is defined in register address 44h. S<sub>PLL</sub>[6:0] is defined in register 46h (see Table 3) which also contains a number of separate control bits relating to the PLL's function.

Writing to registers 44h and 46h enables pre-programming of the required clock mode before the PLL output is selected.

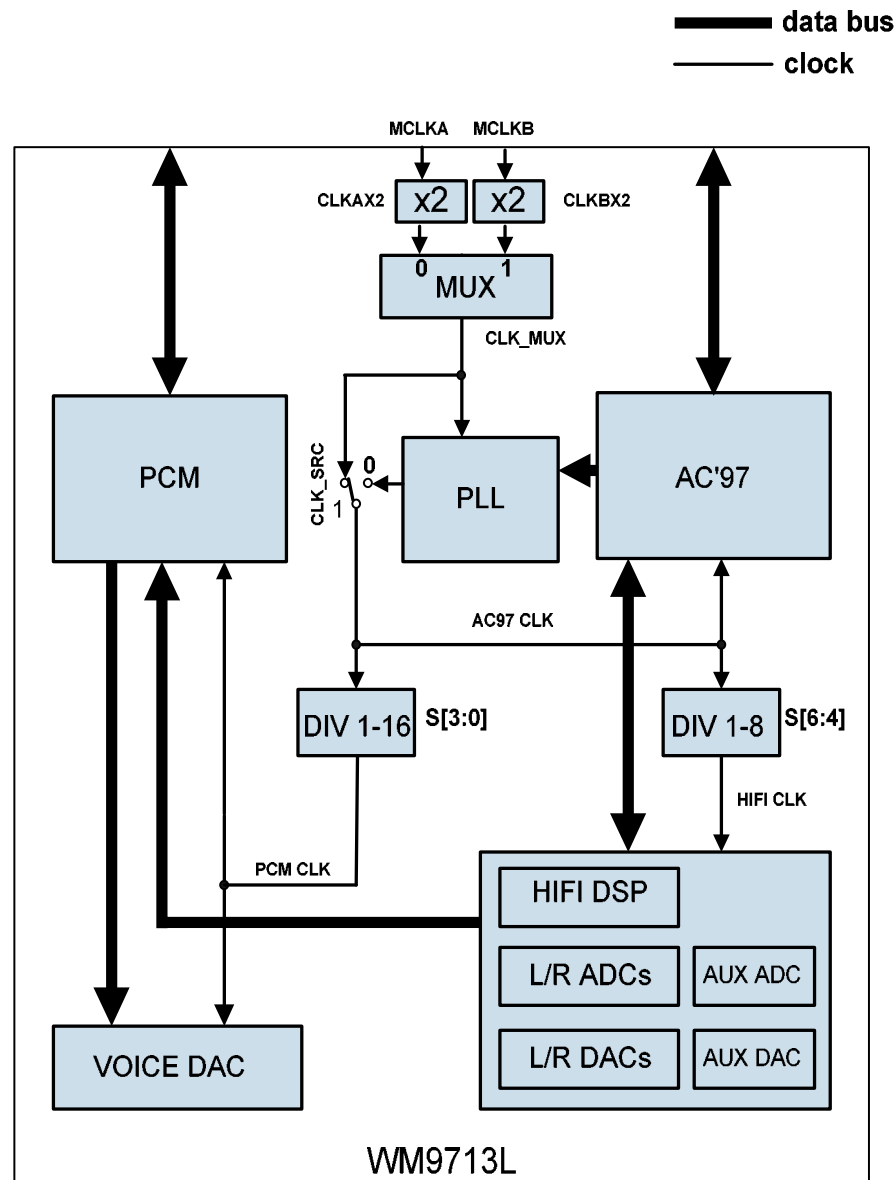

Figure 2 Clocking Architecture for WM9713L

Clock mode and division ratios are controlled by register 44h as shown in Table 1.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
44h	14:12	SEXT[6:4]	000 (div 1)	Defines clock division ratio for Hi-fi block: 000: f 001: f/2 ... 111: f/8
	11:8	SEXT[3:0]	0000 (div 1)	Defines clock division ratio for PCM interface and voice DAC: 0000: f 0001: f/1 ... 1111: f/16
	7	CLKSRC	1 (ext clk)	Selects between PLL clock and External clock
	5:3	PENDIV	000 (div 16)	Sets PENADC clock divisor 000: f/16 001: f/12 010: f/8 011: f/6 100: f/4 101: f/3 110: f/2 111: f
	2	CLKBX2	0 (Off)	Clock doubler for MCLKB
	1	CLKAX2	0 (Off)	Clock doubler for MCLKA
	0	CLKMUX	0 (MCLKA)	Selects between MCLKA and MCLKB (N.B. On power-up clock must be present on MCLKA and must be active for 2 clock cycles after switching to MCLKB)

**Table 1 Clock Muxing and Division Control**

## INTERNAL CLOCK FREQUENCIES

The internal clock frequencies are defined as follows (refer to Figure 2):

- AC97 CLK – nominally 24.576MHz, used to generate AC97 BITCLK at 12.288MHz.
- HIFI CLK – for HIFI playback at 48ks/s HIFI CLK = 24.576MHz. See Table 2 for voice only playback.
- PCM CLK – see Table 2 for sample rate vs clock frequency.

SAMPLE RATE	PCM CLK FREQUENCY	HIFI CLK FREQUENCY
8ks/s voice and HIFI	2.048MHz	24.576MHz
8ks/s voice only (power save)	2.048MHz	4.096MHz
16ks/s voice and HIFI	4.096MHz	24.576MHz
16ks/s voice only (power save)	4.096MHz	8.192MHz
32ks/s voice and HIFI	8.192MHz	24.576MHz
48ks/s voice and HIFI	12.288MHz	24.576MHz

**Table 2 Clock Division Mode Table**

## PEN ADC

The clock for the PENADC nominally runs at 768kHz and is derived from BITCLK. The divisor for the clock generator is set by PENDIV. This enables the PENADC clock frequency to be set according to power consumption and conversion rate considerations.

## PLL MODE

The PLL operation is controlled by register 46h (see Table 3) and has two modes of operation:

- Integer N
- Fractional N

The PLL has been optimized for nominal input clock (PLL\_IN) frequencies in the range 8.192MHz – 19.661MHz (LF=0) and 2.048MHz – 4.9152MHz (LF=1).

Through use of a clock divider (div by 2 / 4) on the input to the PLL frequencies up to 78.6MHz can be accommodated. The input clock divider is enabled by DIVSEL (0=Off) and the division ratio is set by DIVCTL (0=div2, 1=div4).

Figure 3 PLL Architecture

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
46h	15:12	N[3:0]	0000	PLL integer division control (must be set between 5-12 for integer N mode)
	11	LF	0 = off	Allows PLL operation with low frequency input clocks (< 8.192MHz)
	10	SDM	0 = off	Sigma Delta Modulator enable. Allows fractional N division
	9	DIVSEL	0 = off	Enables input clock to PLL to be divided by 2 or 4. Use if input clock is above 14.4MHz
	8	DIVCTL	0	Controls division mode when DIVSEL is high. 0 = div by 2, 1 = div by 4.
	6:4	PGADDR	000	Pager address bits to access programming of K[21:0] and S <sub>PLL</sub> [7:0]
	3:0	PGDATA	0000	Pager data bits

Table 3 PLL Clock Control

### INTEGER N MODE

The nominal output frequency of the PLL (PLL\_OUT) is 98.304MHz which is divided by 4 to achieve a nominal system clock of 24.576MHz.

The integer division ratio (N) is determined by:  $F_{PLL\_out} / F_{PLL\_IN}$ , and is set by N[3:0] and must be in the range 5 to 12 for integer N operation (0101 = div by 5, 1100 = div by 12). Note that setting LF=1 enables a further division by 4 required for input frequencies in the range 2.048MHz – 4.096MHz.

Integer N mode is selected by setting SDM=0.

### FRACTIONAL N MODE

Fractional N mode provides a divide resolution of  $1/2^{22}$  and is set by K[21:0] (register 46h, see section PLL Register Page Address Mapping). The relationship between the required division X, the fractional division K[21:0] and the integer division N[3:0] is:

$$K = 2^{22}(X - N)$$

where  $0 < (X - N) < 1$  and K is rounded to the nearest whole number.

For example, if the PLL\_IN clock is 13MHz and the desired PLL\_OUT clock is 98.304MHz then the desired division, X, is 7.5618. So N[3:0] will be 7h and K[21:0] will be 23F488h to produce the desired 98.304MHz clock (see Table 4).

INPUT CLOCK (PLL_IN)	DESIRED PLL OUTPUT (PLL_OUT)	DIVISION REQUIRED (X)	FRACTIONAL DIVISION (K)	INTEGER DIVISION (N)
2.048MHz	98.304MHz	48	0	12x4*
4.096MHz	98.304MHz	24	0	6x4*
12.288MHz	98.304MHz	8	0	8
13MHz	98.304MHz	7.5618	0.5618	7
27MHz (13.5MHz)**	98.304MHz	7.2818	0.2818	7
*Divide by 4 enabled in PLL feedback path for low frequency inputs. (LF = 1)				
**Divide by 2 enabled at PLL input for frequencies > 14.4MHz > 38MHz (DIVSEL = 1, DIVCTL = 0)				

**Table 4 PLL Modes of Operation**

### PLL REGISTER PAGE ADDRESS MAPPING

The clock division control bits SPLL[6:0] and the PLL fractional N division bits are accessed through register 46h using a sub-page address system. The 3 bit pager address allows 8 blocks of 4 bit data words to be accessed whilst the register address is set to 46h. This means that when register address 46h is selected a further 7 cycles of programming are required to set all of the page data bits. Control bit allocation for these page addresses is described in Table 5.

PAGE ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
111	31:28	SPLL[6:4]	0h	Clock division control bus SPLL[6:0]. Clock divider reads this control word if PLL is enabled
110	27:24	SPLL[3:0]	0h	
101	23:22	SPARE	0h	Spare control bits
	21:20	K[21:0]	0h	Sigma Delta Modulator control word for fractional N division. Division resolution is $1/2^{22}$
100	19:16		0h	
011	15:12		0h	
010	11:8		0h	
001	7:4		0h	
000	3:0		0h	

**Table 5 Pager Control Bit Allocation**

Powerdown for the PLL and internal clocks is via registers 26h and 3Ch (see Table 6).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
26h	13	PR5	1 (Off)	Internal clock disable (active high)
3Ch	9	PLL	1 (Off)	PLL powerdown (active high)
N.B. both PR5 and PLL must be asserted low before PLL is enabled				

**Table 6 PLL Powerdown Control**

## DATA AND CONTROL INTERFACE

The WM9713L has two interfaces, a data and control AC'97 interface and a data only PCM interface. The AC'97 interface is available through dedicated pins (SDATAOUT, SDATAIN, SYNC, BITCLK and RESETB) and is the sole control interface with access to all data streams on the device except for the Voice DAC. The PCM interface is available through the GPIO pins (PCMCLK, PCMFS, PCMDAC and PCMADC) and provides access to the Voice DAC. It can also transmit the data from the Stereo ADC. This can be useful, for example, to allow both sides of a phone conversation to be recorded by mixing the transmit and receive paths on one of the ADC channels and transmitting it over the PCM interface.

## AC97 INTERFACE

### INTERFACE PROTOCOL

The WM9713L has a single AC'97 interface for both data transfer and control. The AC-Link uses 5 wires:

- SDATAIN (pin 8) carries data from the WM9713L to the controller
- SDATAOUT (pin 5) carries data from the controller to the WM9713L
- BITCLK (pin 6) is a clock, derived from either MCLKA or MCLKB inputs and supplied to the controller.
- SYNC is a synchronization signal generated by the controller and passed to the WM9713L
- RESETB resets the WM9713L to its default state

**Figure 4 AC-Link Interface (typical case with BITCLK generated by the AC97 codec)**

The SDATAIN and SDATAOUT signals each carry 13 time-division multiplexed data streams (slots 0 to 12). A complete sequence of slots 0 to 12 is referred to as an AC-Link frame, and contains a total of 256 bits. The frame rate is 48kHz. This makes it possible to simultaneously transmit and receive multiple data streams (e.g. audio, touchpanel, AUXDAC, control) at sample rates up to 48kHz.

Detailed information can be found in the AC'97 (Revision 2.2) specification, which can be obtained at [www.intel.com/labs/media/audio/](http://www.intel.com/labs/media/audio/)

**Note:**

SDATAOUT and SYNC must be held low for when RESETB is applied. These signals must be held low for the entire duration of the RESETB pulse and especially during the low-to-high transition of RESETB. If either is set high during reset the AC'97 device may enter test modes. Information relating to this operation is available in the AC'97 specification or in Wolfson applications note WAN-0104 available at [www.wolfsonmicro.com](http://www.wolfsonmicro.com).

## PCM INTERFACE

### OPERATION

WM9713L can implement a PCM voice codec function using the dedicated VXDAC and either one or both of the existing hi-fi ADC's. In PCM codec mode, VXDAC input and ADC output are interfaced via a PCM style port via GPIO pins.

This interface can support one ADC channel, or stereo/dual ADC channels if required, (two channels of data are sent per PCM frame as back to back words).

In voice only mode, the AC link is used only for control information, not audio data. Therefore it will generally be shut down (PR4=1), except when control data must be sent.

The PCM interface makes use of 4 of the GPIO interface pins, for clock, frame, and data in/out. If the PCM codec function is not enabled then the GPIO pins may be used for other functions as on WM9713L

### INTERFACE PROTOCOL

The WM9713L PCM audio interface is used for the input of data to the Voice DAC and the output of data from the Stereo ADC. When enabled, the PCM audio interface uses four GPIO pins:

- GPIO1/PCMCLK: Bit clock
- GPIO3/PCMFS: Frame Sync
- GPIO4/PCMDAC: Voice DAC data input
- GPIO5/PCMADC: Stereo ADC data output

When not enabled the GPIOs may be used for other functions on the WM9713L.

### PCM INTERFACE MODES

The WM9713L PCM audio interface may be configured in one of four modes:

- Disabled Mode: The WM9713L disables and tri-states all PCM interface pins. Any clock input is ignored and ADC/DAC data is not transferred.
- Slave Mode: The WM9713L accepts PCMCLK and PCMFS as inputs from an external source.
- Master Mode: The WM9713L generates PCMCLK and PCMFS as outputs.
- Partial Master Mode: The WM9713L generates PCMCLK as an output, and accepts PCMFS as an external input.

The PCMDAC and PCMADC pins are normally used as DAC input and ADC output respectively. The WM9713L allows these functions to be swapped allowing DAC input on PCMADC and ADC output on PCMDAC.

### PCM AUDIO DATA FORMATS

Four different audio data formats are supported:

- DSP mode
- Left justified
- Right justified
- I<sup>2</sup>S

All four of these modes are MSB first. They are described below. Refer to the Electrical Characteristic section for timing information.

The PCM Interface may be configured for Mono mode, where only one channel of ADC data is output. In this mode the interface should be configured for DSP mode. A short or long frame sync is supported and the MSB is available on either the 1st (mode B) or 2nd (mode A) rising edge of VXCLK.

Note that when operating in stereo mode the mono Voice DAC always uses the left channel data as its input.

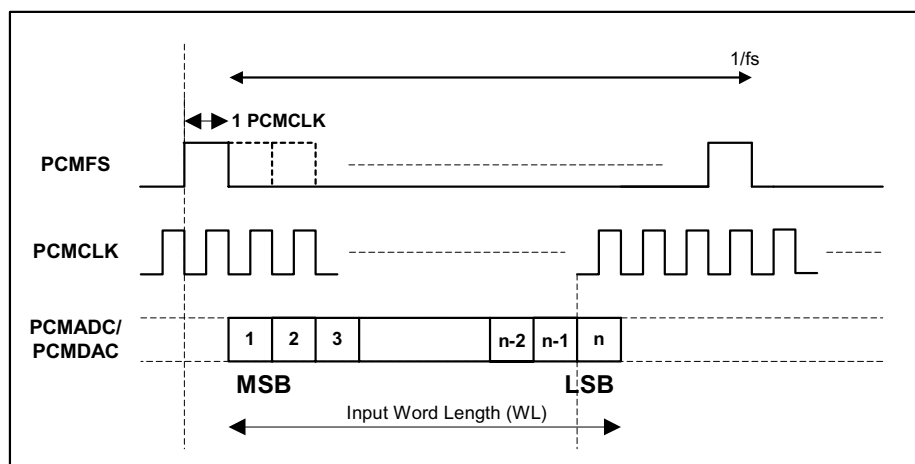

Figure 5 PCM Interface Mono Mode (mode A, FSP=0)

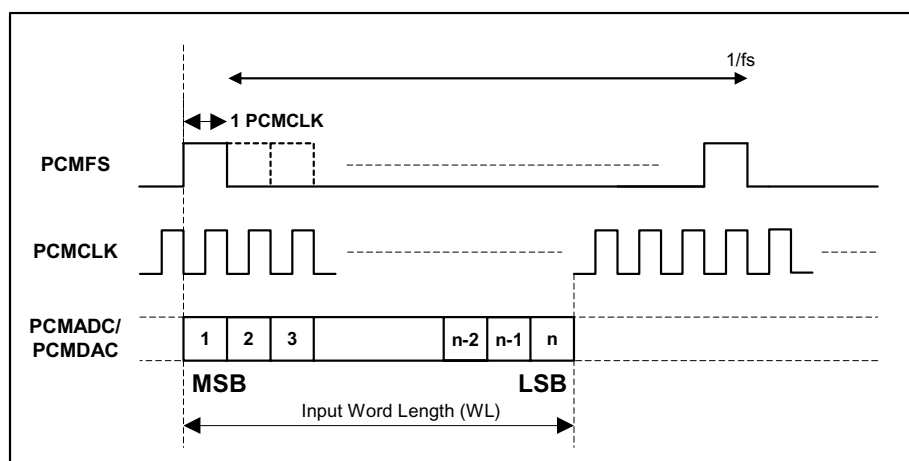

Figure 6 PCM Interface Mono Mode (mode B, FSP=1)

In DSP mode, the left channel MSB is available on either the 1st (mode B) or 2nd (mode A) rising edge of PCMCLK (selectable by FSP) following a rising edge of PCMFs. Right channel data immediately follows left channel data. Depending on word length, PCMCLK frequency and sample rate, there may be unused PCMCLK cycles between the LSB of the right channel data and the next sample.

Figure 7 DSP Mode Audio Interface (mode A, FSP=0)

Figure 7 DSP Mode Audio Interface (mode B, FSP=1)

In Left Justified mode, the MSB is available on the first rising edge of PCMCLK following a PCMFS transition. The other bits up to the LSB are then transmitted in order. Depending on word length, PCMCLK frequency and sample rate, there may be unused PCMCLK cycles before each PCMFS transition.

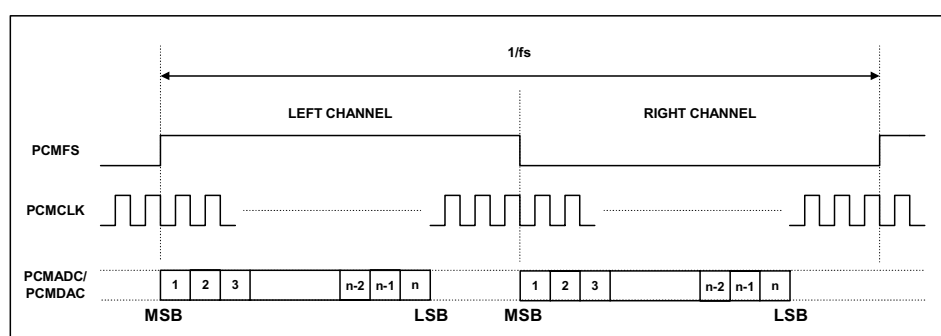

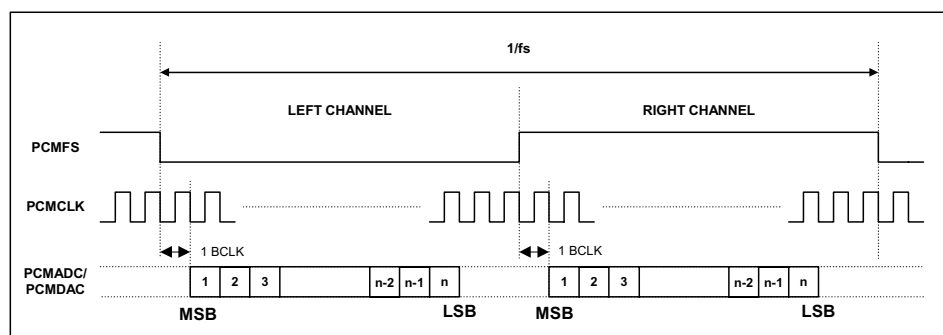

Figure 8 Left Justified Audio Interface (assuming n-bit word length)

In Right Justified mode, the LSB is available on the last rising edge of PCMCLK before a PCMFS transition. All other bits are transmitted before (MSB first). Depending on word length, PCMCLK frequency and sample rate, there may be unused PCMCLK cycles after each PCMFS transition.

**Figure 9 Right Justified Audio Interface (assuming n-bit word length)**

In I<sup>2</sup>S mode, the MSB is available on the second rising edge of PCMCLK following a PCMFs transition. The other bits up to the LSB are then transmitted in order. Depending on word length, PCMCLK frequency and sample rate, there may be unused PCMCLK cycles between the LSB of one sample and the MSB of the next.

**Figure 10 I<sup>2</sup>S Justified Audio Interface (assuming n-bit word length)**

## CONTROL

The register bits controlling PCM audio format, word length and operating modes are summarised below. CTRL must be set to override the normal use of the PCM interface pins as GPIOs, MODE must be set to specify master/slave modes.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
36h PCM Control	15	CTRL	0	Sets function and control registers for GPIO / PCM interface pins. 0 = GPIO pins as GPIOs 1 = GPIO pins configured as PCM interface and controlled by this register
	14:13	MODE	10	PCM interface mode when CTRL=1 00 = PCM interface disabled [PCMCLK tri-stated, PCMFs tri-stated] 01 = PCM interface in slave mode [PCMCLK as input, PCMFs as input] 10 = PCM interface in master mode [PCMCLK as output, PCMFs as output] 11 = PCM interface in partial master mode [PCMCLK as output, PCMFs as input]
	12	SWAP	0	PCM data swap 0 = DAC data input on PCMDAC, ADC data output on PCMDAC 1 = DAC data input on PCMDAC, ADC data output on PCMDAC

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
	11:9	DIV	010	Voice DAC clock to PCMCLK divider. In master mode PCMCLK is derived from Voice DAC clock. 000 : PCMCLK = Voice DAC clock 001 : PCMCLK = Voice DAC clock / 2 010 : PCMCLK = Voice DAC clock / 4 011 : PCMCLK = Voice DAC clock / 8 100 : PCMCLK = Voice DAC clock / 16

Table 7 PCM Codec Control

**Note:** Right justified does not support 32-bit data.

## AUDIO ADCS

### STEREO ADC

The WM9713L has a stereo sigma-delta ADC to digitize audio signals. The ADC achieves high quality audio recording at low power consumption. The ADC sample rate can be controlled by writing to a control register (see "Variable Rate Audio"). It is independent of the DAC sample rate.

To save power, the left and right ADCs can be separately switched off using the Powerdown bits ADCL and ADCR (register 3Ch, bits 5:4), whereas PR0 disables both ADCs (see "Power Management" section). If only one ADC is running, the same ADC data appears on both the left and right AC-Link slots.

The output from the ADC can be sent over either the AC link as usual, or output via the PCM interface which may be configured on the GPIO pins.

### HIGH PASS FILTER

The WM9713L audio ADC incorporates a digital high pass filter that eliminates any DC bias from the ADC output data. The filter is enabled by default. For DC measurements, it can be disabled by writing a '1' to the HPF bit (register 5Ch, bit 3).

This high pass filter corner frequency can be selected to have different values in WM9713L, to suit applications such as voice where a higher cutoff frequency is required.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
5Ah	5:4	HPMODE	00	HPF corner frequency 00: 7Hz @ Fs=48kHz 01: 82Hz @ Fs=16kHz 10: 82Hz @ Fs=8kHz 11: 170Hz @ Fs=8kHz
<b>Note:</b> the filter corner frequency is proportional to the sample rate.				

**Table 8 ADC Highpass Filter Frequency Control**

### ADC SLOT MAPPING

By default, the output of the left audio ADC appears on slot 3 of the SDATAIN signal (pin 8), and the right ADC data appears on slot 4. However, the ADC output data can also be sent to other slots, by setting the ASS (ADC slot select) control bits as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
5Ch Additional Functions (2)	1:0	ASS	00	ADC to slot mapping 00: Left = Slot 3, Right = Slot 4 (default) 01: Left = Slot 7, Right = Slot 8 10: Left = Slot 6, Right = Slot 9 11: Left = Slot 10, Right = Slot 11
	3	HPF	0	High-pass filter disable 0: Filter enabled (for audio) 1: Filter disabled (for DC measurements)

**Table 9 ADC Control**

## RECORD SELECTOR

The record selector determines which input signals are routed into the audio ADC. The left and right channels can be selected independently. This is useful for recording a phone call: one channel can be used for the RX signal and the other for the TX signal, so that both sides of the conversation are digitized.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
14h Record Routing / Mux Select	6	RECBST	0	20dB Boost 1: Boost ADC input signal by 20dB 0 :No boost
	5:3	RECSL	000	Left ADC signal source 000: MICA (pre-PGA) 001: MICB (pre-PGA) 010: LINEL (pre-PGA) 011: MONOIN (pre-PGA) 100: Headphone Mix (left) 101: Speaker Mix 110: Mono Mix 111: Reserved (do not use this setting)
	2:0	RECSR	000	Right ADC signal source 000: MICA (pre-PGA) 001: MICB (pre-PGA) 010: LINER (pre-PGA) 011: MONOIN (pre-PGA) 100: Headphone Mix (right) 101: Speaker Mix 110: Mono Mix 111: Reserved (do not use this setting)

**Table 10 Audio Record Selector**

## RECORD GAIN

The amplitude of the signal that enters the audio ADC is controlled by the Record PGA (Programmable Gain Amplifier). The PGA gain can be programmed either by writing to the Record Gain register, or by the Automatic Level Control (ALC) circuit (see next section). When the ALC is enabled, any writes to the Record Gain register have no effect.

Two different gain ranges can be implemented: the standard gain range defined in the AC'97 standard, or an extended gain range with smaller gain steps. The ALC circuit always uses the extended gain range, as this has been found to result in better sound quality.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
12h Record Gain	15	RMU	1	Mute Audio ADC (both channels) 1: Mute (OFF) 0: No Mute (ON)
	14	GRL	0	Gain range select (left) 0: Standard (0 to 22.5dB, 1.5dB step size) 1: Extended (-17.25 to +30dB, 0.75dB steps)
	13:8	RECVOLL	000000	Record Volume (left)
				Standard (GRL=0)      Extended (GRL=1)
				XX0000: 0dB              000000: -17.25dB XX0001: +1.5dB        000001: -16.5dB ... (1.5dB steps)      ... (0.75dB steps) XX1111: +22.5dB      111111: +30dB
	7	ZC	0	Zero Cross Enable 0: Record Gain changes immediately 1: Record Gain changes when signal is zero or after time-out
	6	GRR	0	Gain range select (right) Similar to GRL
	5:0	RECVOLR	000000	Record Volume (right) Similar to RECVOLL

**Table 11 Record Gain Register**

The output of the Record PGA can also be mixed into the phone and/or headphone outputs (see "Audio Mixers"). This makes it possible to use the ALC function for the microphone signal in a smartphone application.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
14h Record Routing	15:14	R2H	11 (mute)	Controls record mux to headphone mixer paths. 00=stereo, 01=left rec mux only, 10=right rec mux only, 11=mute left and right
	13:11	R2HVOL	010 (0dB)	Controls gain of record mux l/r to headphone mixer paths. 000: +6dB 001: +3dB ... (3dBsteps) 111: -15dB
	10:9	R2M	11 (mute)	Controls record mux to mono mixer path. 00=stereo, 01=left rec mux only, 10=right rec mux only, 11=mute left and right
	8	R2MBST	0 (OFF)	Enables 20dB gain boost for record mux to mono mixer path

**Table 12 Record PGA Routing Control**

## AUTOMATIC LEVEL CONTROL

The WM9713L has an automatic level control that aims to keep a constant recording volume irrespective of the input signal level. This is achieved by continuously adjusting the PGA gain so that the signal level at the ADC input remains constant. A digital peak detector monitors the ADC output and changes the PGA gain if necessary.

**Figure 11 ALC Operation**

The ALC function is enabled using the ALCSEL control bits. When enabled, the recording volume can be programmed between  $-6\text{dB}$  and  $-28.5\text{dB}$  (relative to ADC full scale) using the ALCL register bits.

HLD, DCY and ATK control the hold, decay and attack times, respectively.

### HOLD TIME

Hold time is the time delay between the peak level detected being below target and the PGA gain beginning to ramp up. It can be programmed in power-of-two ( $2^n$ ) steps, e.g. 2.67ms, 5.33ms, 10.67ms etc. up to 43.7s. Alternatively, the hold time can also be set to zero. The hold time only applies to gain ramp-up, there is no delay before ramping the gain down when the signal level is above target.

### DECAY (GAIN RAMP-UP) TIME

Decay time is the time that it takes for the PGA gain to ramp up across 90% of its range (e.g. from  $-15\text{B}$  up to  $27.75\text{dB}$ ). The time it takes for the recording level to return to its target value therefore depends on both the decay time and on the gain adjustment required. If the gain adjustment is small, it will be shorter than the decay time. The decay time can be programmed in power-of-two ( $2^n$ ) steps, from 24ms, 48ms, 96ms, etc. to 24.58s.

### ATTACK (GAIN RAMP-DOWN) TIME

Attack time is the time that it takes for the PGA gain to ramp down across 90% of its range (e.g. from 27.75dB down to -15B gain). The time it takes for the recording level to return to its target value therefore depends on both the attack time and on the gain adjustment required. If the gain adjustment is small, it will be shorter than the attack time. The attack time can be programmed in power-of-two ( $2^n$ ) steps, from 6ms, 12ms, 24ms, etc. to 6.14s.

When operating in stereo, the peak detector takes the maximum of left and right channel peak values, and any new gain setting is applied to both left and right PGAs, so that the stereo image is preserved. However, the ALC function can also be enabled on one channel only. In this case, only one PGA is controlled by the ALC mechanism, while the other channel runs independently with its PGA gain set through the control register.

When one ADC channel is unused, the peak detector disregards that channel. The ALC function can also operate when the two ADC outputs are mixed to mono in the digital domain, but not if they are mixed to mono in the analogue domain, before entering the ADCs.

### ALC ZERO CROSS

The ALC has a zero cross detection circuit. When enabled, the PGA gain will be updated when the signal is at zero or after a time out period. This is controlled through the ALC enable ALCZC, register 62h bit 8, and the time out control ZCTIMEOUT, register 62h bit 10:9. The time out signal is a function of the BITCLK period as defined in Table 13.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
62h ALC / Noise Gate Control	15:14	ALCSEL	00 (OFF)	ALC function select 00 = ALC off (PGA gain set by register) 01 = Right channel only 10 = Left channel only 11 = Stereo (PGA registers unused)

Table 13 ALC Control

**MAXIMUM GAIN**

The MAXGAIN register sets the maximum gain value that the PGA can be set to whilst under the control of the ALC. This has no effect on the PGA when ALC is not enabled.

## PEAK LIMITER

To prevent clipping when a large signal occurs just after a period of quiet, the ALC circuit includes a limiter function. If the ADC input signal exceeds 87.5% of full scale ( $-1.16\text{dB}$ ), the PGA gain is ramped down at the maximum attack rate (as when  $\text{ATK} = 0000$ ), until the signal level falls below 87.5% of full scale. This function is automatically enabled whenever the ALC is enabled.

(Note: If  $\text{ATK} = 0000$ , then the limiter makes no difference to the operation of the ALC. It is designed to prevent clipping when long attack times are used).

## NOISE GATE

When the signal is very quiet and consists mainly of noise, the ALC function may cause “noise pumping”, i.e. loud hissing noise during silence periods. The WM9713L has a noise gate function that prevents noise pumping by comparing the signal level at the input pins (i.e. before the record PGA) against a noise gate threshold, NGTH. Provided that the noise gate function is enabled ( $\text{NGAT} = 1$ ), the noise gate cuts in when:

$$\text{Signal level at ADC [dB]} < \text{NGTH [dB]} + \text{PGA gain [dB]} + \text{Mic Boost gain [dB]}$$

This is equivalent to:

$$\text{Signal level at input pin [dB]} < \text{NGTH [dB]}$$

The PGA gain is then held constant (preventing it from ramping up as it normally would when the signal is quiet). If the NGG bit is set, the ADC output is also muted when the noise gate cuts in.

The table below summarises the noise gate control register. The NGTH control bits set the noise gate threshold with respect to the ADC full-scale range. The threshold is adjusted in 1.5dB steps. Levels at the extremes of the range may cause inappropriate operation, so care should be taken with set-up of the function. Note that the noise gate only works in conjunction with the ALC function, and always operates on the same channel(s) as the ALC (left, right, both, or none).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
62h ALC / Noise Gate Control	7	NGAT	0	Noise gate function enable 1 = enable 0 = disable

Table 14 Noise Gate Control

## AUDIO DACS

### STEREO DAC

The WM9713L has a stereo sigma-delta DAC that achieves high quality audio playback at low power consumption. Digital tone control, adaptive bass boost and 3-D enhancement functions operate on the digital audio data before it is passed to the stereo DAC. (Contrary to the AC'97 specification, they have no effect on analogue input signals or signals played through the auxiliary DAC. Nevertheless, the ID2 and ID5 bits in the reset register, 00h, are set to '1' to indicate that the WM9713L supports tone control and bass boost.)

The DAC output has a PGA for volume control. The DAC sample rate can be controlled by writing to a control register (see "Variable Rate Audio"). It is independent of the ADC sample rate.

When not in use the DACs can be separately powered down using the Powerdown register bits DACL and DACR (register 3Ch, bits [7:6]).

#### STEREO DAC VOLUME

The volume of the DAC output signal is controlled by a PGA (Programmable Gain Amplifier). Each DAC can be mixed into the headphone, speaker and mono mixer paths (see "Audio Mixers") controlled by register 0Ch.

Each DAC-to-mixer path has an independent mute bit. When all DAC-to-mixer paths are muted the DAC PGA is muted automatically.

When not in use the DAC PGAs can be powered down using the Powerdown register bits DACL and DACR (register 3Ch, bits [7:6]).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 15 Stereo DAC Volume Control

## TONE CONTROL / BASS BOOST

The WM9713L provides separate controls for bass and treble with programmable gains and filter characteristics. This function operates on digital audio data before it is passed to the audio DACs.

Bass control can take two different forms:

- Linear bass control: bass signals are amplified or attenuated by a user programmable gain. This is independent of signal volume, and very high bass gains on loud signals may lead to signal clipping.
- Adaptive bass boost: The bass volume is amplified by a variable gain. When the bass volume is low, it is boosted more than when the bass volume is high. This method is recommended because it prevents clipping, and usually sounds more pleasant to the human ear.

Treble control applies a user programmable gain, without any adaptive boost function.

Treble, linear bass and 3D enhancement can all produce signals that exceed full-scale. In order to avoid limiting under these conditions, it is recommended to set the DAT bit to attenuate the digital input signal by 6dB. The gain at the outputs should be increased by 6dB to compensate for the attenuation. Cut-only tone adjustment and adaptive bass boost cannot produce signals above full-scale and therefore do not require the DAT bit to be set.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
20h DAC Tone Control	15	BB	0	Bass Mode 0 = Linear bass control 1 = Adaptive bass boost
	12	BC	0	Bass Cut-off Frequency 0 = Low (130Hz at 48kHz sampling) 1 = High (200Hz at 48kHz sampling)

**Table 16 DAC Tone Control**

**Note:**

1. All cut-off frequencies change proportionally with the DAC sample rate.

### 3D STEREO ENHANCEMENT

The 3D stereo enhancement function artificially increases the separation between the left and right channels by amplifying the (L-R) difference signal in the frequency range where the human ear is sensitive to directionality. The programmable 3D depth setting controls the degree of stereo expansion introduced by the function. Additionally, the upper and lower limits of the frequency range used for 3D enhancement can be selected using the 3DFILT control bits.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

**Table 17 Stereo Enhancement Control**

**Note:**

1. All cut-off frequencies change proportionally with the DAC sample rate.

### VOICE DAC

VXDAC is a 16-bit mono DAC intended for playback of Rx voice signals input via the PCM interface. Typically it is used at 8ks/s, but may be used at other sample rates up to 48ks/s.

The analogue output of VXDAC is routed directly into the output mixers. The signal gain into each mixer can be adjusted at the mixer inputs using control register 1Eh.

When not in use the VXDAC can be powered down using the Powerdown register bit VXDAC (register 3Ch, bit 12).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
3Ch Powerdown (1)	12	VXDAC	1	VXDAC powerdown bit 1: OFF, 0: ON

Table 18 VXDAC Control

## AUXILIARY DAC

AUXDAC is a simple 12-bit mono DAC. It can be used to generate DC signals (with the numeric input written into a control register), or AC signals such as telephone-quality ring tones or system beeps (with the input signal supplied through an AC-Link slot). In AC mode (XSLE = 1), the input data is binary offset coded; in DC mode (XSLE = 0), there is no offset.

The analogue output of AUXDAC is routed directly into the output mixers. The signal gain into each mixer can be adjusted at the mixer inputs using control register 12h. In slot mode (XSLE = 1), the AUXDAC also supports variable sample rates (See "Variable Rate Audio" section).

When not in use the auxiliary DAC can be powered down using the Powerdown register bit AUXDAC (register 3Ch, bit 11).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 19 AUXDAC Control

## VARIABLE RATE AUDIO / SAMPLE RATE CONVERSION

By using an AC'97 Rev2.2 compliant audio interface, the WM9713L can record and playback at all commonly used audio sample rates, and offer full split-rate support (i.e. the DAC, ADC and AUXDAC sample rates are completely independent of each other – any combination is possible).

The default sample rate is 48kHz. If the VRA bit in register 2Ah is set, then other sample rates can be selected by writing to registers 2Ch, 32h and 2Eh. The AC-Link continues to run at 48k frames per second irrespective of the sample rate selected. However, if the sample rate is less than 48kHz, then some frames do not carry an audio sample.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
2Ah Extended Audio Stat/Ctrl	0	VRA	0 (OFF)	Variable Rate Audio 0: OFF (DAC and ADC run at 48kHz) 1: ON (sample rates determined by registers 2Ch and 32h)
2Ch Audio DAC Sample Rate	15:0	DACSR	BB80h (48kHz)	Audio DAC sample rate 1F40h: 8kHz 2B11h: 11.025kHz 2EE0h: 12kHz 3E80h: 16kHz 5622h: 22.05kHz 5DC0h: 24kHz 7D00h: 32kHz AC44h: 44.1kHz BB80h: 48kHz Any other value defaults to the nearest supported sample rate

2Eh AUXDAC Sample Rate	15:0	AUXDA CSR	BB80h (48kHz)	AUXDAC sample rate similar to DACSR

**Table 20 Audio Sample Rate Control**

## AUDIO INPUTS

The following sections give an overview of the analogue audio input pins and their function. For more information on recommended external components, please refer to the "Applications Information" section.

### LINE INPUT

The LINEL and LINER inputs are designed to record line level signals, and/or to mix into one of the analogue outputs.

Both pins are directly connected to the record selector. The record PGA adjusts the recording volume, controlled by register 12h or by the ALC function.

For analogue mixing, the line input signals pass through a separate PGA, controlled by register 0Ah. The signals can be mixed into the headphone, speaker and mono mixer paths (see "Audio Mixers").

Each LINE-to-mixer path has an independent mute bit. When all LINE-to-mixer paths are muted the line PGA is muted automatically. When the line inputs are not used, the line PGA can be switched off to save power (see "Power Management" section).

LINEL and LINER are biased internally to the reference voltage VREF. Whenever the inputs are muted or the device placed into standby mode, the inputs remain biased to VREF using special anti-thump circuitry to suppress any audible clicks when changing inputs.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
0Ah	15	L2H	1	Mute LINE path to headphone mixer 1: Mute, 0: No mute (ON)
	14	L2S	1	Mute LINE path to speaker mixer 1: Mute, 0: No mute (ON)
	13	L2M	1	Mute LINE path to mono mixer 1: Mute, 0: No mute (ON)
	12:8	LINEL VOL	01000 (0dB)	LINEL input gain 00000: +12dB ... (1.5dB steps) 11111: -34.5dB
	4:0	LINER VOL	01000 (0dB)	LINER input gain similar to LINELVOL

**Table 21 Line Input Control**

Additionally, line inputs can be used as single-ended microphone inputs through the record mux to provide a clickless ALC function by bypassing offset introduced through the microphone pre-amps. Note that the line inputs to the mixers should all be deselected if this is input configuration is used.

## MICROPHONE INPUT

### MICROPHONE PRE-AMPS

There are two microphone pre-amplifiers which can be configured in a variety of ways to accommodate up to 3 selectable differential microphone inputs or 2 differential microphone inputs for stereo or noise cancellation. The microphone input circuit is shown in Figure 12.

Figure 12 Microphone Input Circuit

The input pins used for the microphones are MIC1, MICCM, MIC2A and MIC2B. Note that input pins MIC2A and MIC2B are multi-function inputs and must be configured for use as microphone inputs when required. This is achieved using MICCMPSEL[1:0] in register 22h (see Table 22). The input to microphone pre-amp A can be selected from any of the three microphone inputs MIC1, MIC2A and MIC2B using MPASEL[1:0]. Each pre-amp has independent boost control from +12dB to +30dB in four steps. This is controlled by MPABST[1:0] and MPBBST[1:0].

When not in use each microphone pre-amp can be powered down using the Powerdown register bits MPA and MPB (register 3Eh, bits [1:0]). When disabled the inputs are tied to Vmid (for MIC2A and MIC2B this only applies when they are selected as microphone inputs, otherwise they are left floating).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
22h	15:14	MICCMPSEL	00	MIC2A and MIC2B pin configuration 00: MIC2A and MIC2B microphone inputs 01: MIC2A only 10: MIC2B only 11: neither

	11:10	MPABST	00	MICA pre-amp gain control 00 : +12dB 01 : +18dB 10 : +24dB 11 : +30dB
	9:8	MPBBST	00	MICB pre-amp gain control 00 = +12dB 01 = +18dB 10 = +24dB 11 = +30dB

Table 22 Microphone Pre-amp Control

### SINGLE MIC OPERATION

Up to three microphones can be connected in a single-ended configuration. Any one of the three MICs can be selected as the input to MPA using MPASEL[1:0] (Register 22h, bits 13:12). Only the microphone on MIC2B can be selected to MPB. Note that MPABST always sets the gain for the selected MPA input microphone. If MIC2B is the selected input for MPA it is recommended that MPB is disabled.

### DUAL MIC OPERATION

Up to two microphones can be connected in a dual differential configuration. This is suitable for stereo microphone or noise cancellation applications. Mic1 is connected between the MIC2A and MICCM inputs and mic2 is connected between the MIC2B and MICCM inputs as shown in Figure 13. Additionally, another microphone can be supported on MIC1 selected through the MPA input mux. Note that the microphones can be connected in a single-ended configuration.

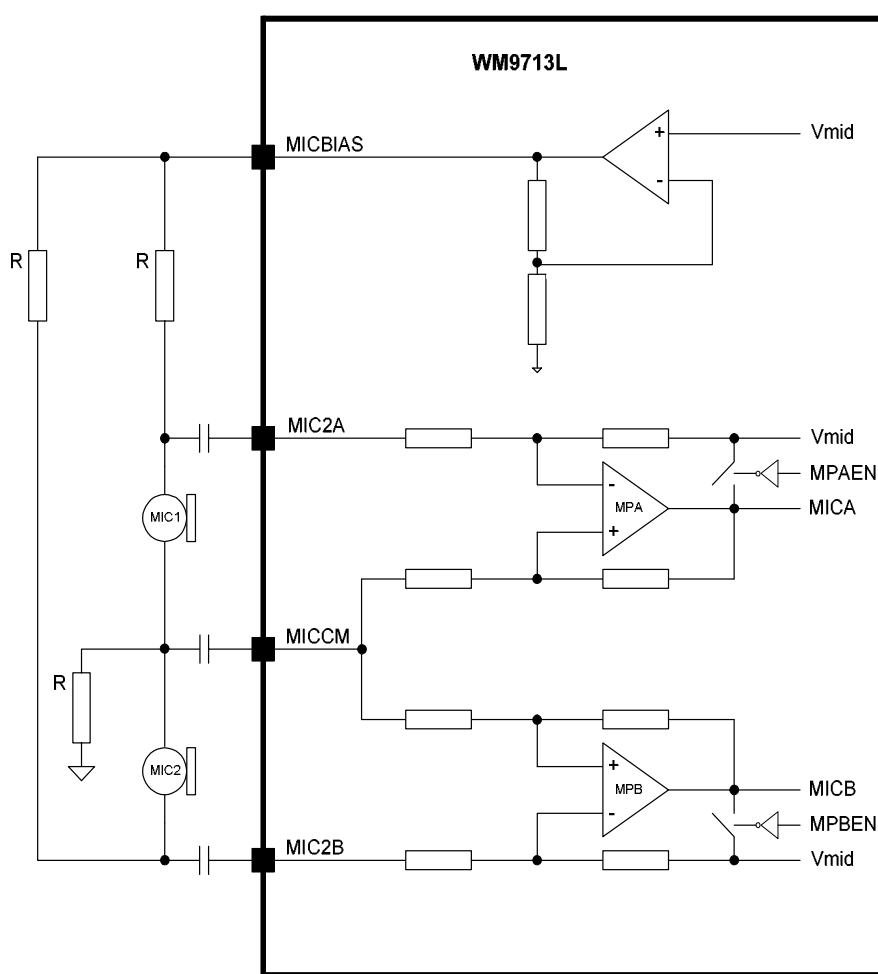

Figure 13 Dual Microphone Configuration

### MICROPHONE BIASING CIRCUIT

The MICBIAS output provides a low noise reference voltage suitable for biasing electret type microphones and the associated external resistor biasing network. Refer to the Applications Information section for recommended external components. The MICBIAS voltage can be altered via MBVOL in register 22h. When MBVOL=0, MICBIAS=0.9\*AVDD and when MBVOL=1, MICBIAS=0.75\*AVDD.

The microphone bias is driven to a dedicated MICBIAS pin 28 and is enabled by MPOP1EN in register 22h. It can also be configured to drive out on GPIO8 pin 12 enabled by MPOP2EN in register 22h.

When not in use the microphone bias can be powered down using the Powerdown register bit MICBIAS (register 3Eh, bit 14).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
22h	7	MBOP2EN	0 (Off)	Microphone bias enable to GPIO8 (pin 12)
	6	MBOP1EN	0 (Off)	Microphone bias enable to MICBIAS (pin 28)
	5	MBVOL	0	Microphone bias voltage control 0: $0.9 \times AVDD$ 1: $0.75 \times AVDD$

**Table 23 Microphone Bias Voltage Control**

The internal MICBIAS circuitry is shown in Figure 14. Note that the maximum source current capability for MICBIAS is 3mA. The external biasing resistors therefore must be large enough to limit the MICBIAS current to 3mA.

**Figure 14 Microphone Bias Schematic**

#### MICBIAS CURRENT DETECT

The WM9713L includes a microphone bias current detect circuit which allows the user to set thresholds for the microphone bias current, above which an interrupt will be triggered. There are two separate interrupt bits, MICDET to allow the user to e.g. distinguish between one or two microphones connected to the WM9713L, and MICSHT to detect a shorted microphone (mic button press). The microphone current detect threshold is set by MCDTHR[2:0], for MICDET, and MCDSCTHR[1:0] for MICSHT. Thresholds for each code are shown in Table 24

When not in use the microphone bias current detect circuit can be powered down using the Powerdown register bit MCD (register 3Eh, bit 15).

See the GPIO and Interrupt Controller sections for details on the interrupt and status readback for the microphone bias current detect & microphone short circuit detect.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
22h	4:2	MCDTHR	000	Mic current detect threshold 000:100uA 001:200uA ....100uA steps up to 111:800uA These values are for 3.3V supply and scale with supply voltage (AVDD).
	1:0	MCDSCCTR	00	Mic current detect short circuit threshold 00: 600uA 01: 1200uA 10: 1800uA 11: 2400uA These values are for 3.3V supply and scale with supply voltage (AVDD).

Table 24 Microphone Current Detect Control

**MICROPHONE PGAS**

The microphone pre-amps MPA and MPB drive into two microphone PGAs whose gain is controlled by register 0Eh. The PGA signals can be routed into the headphone mixers and the mono mixer, but not the speaker mixer (to prevent forming a feedback loop) controlled by register 10h. When the PGA signals are not selected as an input to any of the mixers the outputs of the PGAs are muted automatically.

When not in use the microphone PGAs can be powered down using the Powerdown register bits MA and MB (register 3Eh, bits [3:2]).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 26 Microphone PGA Routing Control

## MONOIN INPUT

Pin 20 (MONOIN) is a mono input designed to connect to the receive path of a telephony device. The pin connects directly to the record selector for phone call recording (Note: to record both sides of a phone call, one ADC channel should record the MONOIN signal while the other channel records the MIC signal). The record PGA adjusts the recording volume, and is controlled by register 12h or by the ALC function (see "Record Gain" and "Automatic Level Control" sections).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
14h Record Routing	15:14	R2H	11 (mute)	Controls record mux to headphone mixer paths. 00=stereo, 01=left rec mux only, 10=right rec mux only, 11=mute left and right
	13:11	R2HVOL	010 (0dB)	Controls gain of record mux l/r to headphone mixer paths 000: +6dB ... (3dB steps) 111: -15dB
	10:9	R2M	11 (mute)	Controls record mux to mono mixer path. 00=stereo, 01=left rec mux only, 10=right rec mux only, 11=mute left and right
	8	R2MBST	0 (OFF)	Enables 20dB gain boost for record mux to mono mixer path

**Table 27 Record PGA Routing Control**

To listen to the MONOIN signal, the signal passes through a separate PGA, controlled by register 08h. The signal can be routed into the headphone mixer (for normal phone call operation) and/or the speaker mixer (for speakerphone operation), but not into the mono mixer (to prevent forming a feedback loop). When the signal is not selected as an input to any of the mixers the output of the PGA is muted automatically.

When not in use the MONOIN PGA can be powered down using the Powerdown register bit MOIN (register 3Eh, bit 4).

MONOIN is biased internally to the reference voltage VREF. Whenever the input is muted or the device placed into standby mode, the input remains biased to VREF using special anti-thump circuitry to suppress any audible clicks when changing inputs.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
08h MONOIN PGA Vol / Routing	15	M2H	1	Mute MONIN path to headphone mixer 1: Mute, 0: No mute (ON)
	14	M2S	1	Mute MONOIN path to speaker mixer 1: Mute, 0: No mute (ON)
	12:8	MONOIN VOL	01000 (0dB)	MONOIN input gain 00000: +12dB ... (1.5dB steps) 11111: -34.5dB

**Table 28 Mono PGA Control**

## PCBEEP INPUT

Pin 19 (PCBEEP) is a mono, line level input intended for externally generated signal or warning tones. It is routed directly to the record selector and all three output mixers, without an input amplifier. The signal gain into each mixer can be independently controlled, with a separate mute bit for each signal path.

PCBEEP is biased internally to the reference voltage VREF. When the signal is not selected as an input to any of the mixers the input remains biased to VREF using special anti-thump circuitry to suppress any audible clicks when changing inputs.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
16h PCBEEP input	15	B2H	1	Mute PCBEEP path to headphone mixer 1: Mute, 0: No mute (ON)
	14:12	B2HVOL	010 (0dB)	PCBEEP to headphone mixer gain 000: +6dB ... (3dB steps) 111: -15dB
	11	B2S	1	Mute PCBEEP path to speaker mixer 1: Mute, 0: No mute (ON)
	10:8	B2SVOL	010 (0dB)	PCBEEP to speaker mixer gain 000: +6dB ... (3dB steps) 111: -15dB
	7	B2M	1	Mute PCBEEP path to mono mixer 1: Mute, 0: No mute (ON)
	6:4	B2MVOL	010 (0dB)	PCBEEP to mono mixer gain 000: +6dB ... (3dB steps) 111: -15dB

Table 29 PCBEEP Control

## DIFFERENTIAL MONO INPUT

PCBEEP and MONOIN inputs can be configured to provide a differential mono input. This is achieved by mixing the two inputs together using the headphone mixers or the speaker mixer. Note that the gain of the MONOIN PGA must match the gain of the PCBEEP mixer input to achieve a balanced differential mono input.

## AUDIO MIXERS

### MIXER OVERVIEW

The WM9713L has four separate low-power audio mixers to cover all audio functions required by smartphones, PDAs and handheld computers. These mixers are used to drive the audio outputs HPL, HPR, MONO, SPKL, SPKR, OUT3 and OUT4. There are also two inverters used to provide complementary output driver signals.

### HEADPHONE MIXERS

There are two headphone mixers, headphone mixer left and headphone mixer right (HPMIXL and HPMIXR). These mixers are the stereo output driver source. They are used to drive the stereo outputs HPL and HPR. They can also be used to drive SPKL and SPKR outputs and, when used in conjunction with OUT3 and OUT4, they can be configured to drive complementary signals through the two output inverters to support bridge-tied load (BTL) stereo loudspeaker outputs. The following signals can be mixed into the headphone path:

- MONOIN (controlled by register 08h, see "Audio Inputs")
- LINEL/R (controlled by register 0Ah, see "Audio Inputs")
- the output of the Record PGA (controlled by register 14h, see "Audio ADC", "Record Gain")
- the stereo DAC signal (controlled by register 0Ch, see "Audio DACs")
- the MIC signal (controlled by register 10h, see "Audio Inputs")
- PC\_BEEP (controlled by register 16h, see "Audio Inputs")
- the VXDAC signal (controlled by register 18h, see "Audio DACs")
- the AUXDAC signal (controlled by register 1Ah, see "Auxiliary DAC")

In a typical smartphone application, the headphone signal is a mix of MONOIN / VXDAC and sidetone (for phone calls) and the stereo DAC signal (for music playback).

When not in use the headphone mixers can be powered down using the Powerdown register bits HPLX and HPRX (register 3Ch, bits [3:2]).

### SPEAKER MIXER

The speaker mixer (SPKMIX) is a mono source. It is typically used to drive a mono loudspeaker in BTL configuration. The following signals can be mixed into the speaker path:

- MONOIN (controlled by register 08h, see "Audio Inputs")
- LINEL/R (controlled by register 0Ah, see "Audio Inputs")
- the stereo DAC signal (controlled by register 0Ch, see "Audio DACs")
- PC\_BEEP (controlled by register 16h, see "Audio Inputs")
- the VXDAC signal (controlled by register 18h, see "Audio DACs")
- the AUXDAC signal (controlled by register 1Ah, see "Auxiliary DAC")

In a typical smartphone application, the speaker signal is a mix of AUXDAC (for system alerts or ring tone playback), MONOIN / VXDAC (for speakerphone function), and PC\_BEEP (for externally generated ring tones).

Note that when selected the stereo input pairs LINEL/R and DACL/R are summed and attenuated by -6dB so that 0dBFS signals on each channel sum to give a stereo mixed 0dBFS output.

When not in use the speaker mixer can be powered down using the Powerdown register bit SPKX (register 3Ch, bit 1).

## MONO MIXER

The mono mixer drives the MONO pin. The following signals can be mixed into MONO:

- LINEL/R (controlled by register 0Ah, see "Audio Inputs")
- the output of the Record PGA (controlled by register 14h, see "Audio ADC", "Record Gain")
- the stereo DAC signal (controlled by register 0Ch, see "Audio DACs")
- the MIC signal (controlled by register 10h, see "Audio Inputs")
- PC\_BEEP (controlled by register 16h, see "Audio Inputs")
- the VXDAC signal (controlled by register 18h, see "Audio DACs")
- the AUXDAC signal (controlled by register 12h, see "Auxiliary DAC")

In a typical smartphone application, the MONO signal is a mix of the amplified microphone signal (possibly with Automatic Gain Control) and (if enabled) an audio playback signal from the stereo DAC or the auxiliary DAC.

Note that when selected the stereo input pairs LINEL/R and DACL/R are summed and attenuated by -6dB so that 0dBFS signals on each channel sum to give a stereo mixed 0dBFS output.

When not in use the mono mixer can be powered down using the Powerdown register bit MX (register 3Ch, bit 0).

## MIXER OUTPUT INVERTERS

There are two general purpose mixer output inverters, INV1 and INV2. Each inverter can be selected to drive HPMIXL, HPMIXR, SPKMIX, MONOMIX or  $\{ ( \text{HPMIXL} + \text{HPMIXR} ) / 2 \}$ . The outputs of the inverters can be used to generate complimentary signals (to drive BTL configured loads) and to provide greater flexibility in output driver configurations. INV1 can be selected as the source for SPKL, MONO and OUT3 and INV2 as the source for SPKR and OUT4.

The input source for each inverter is selected using INV1[2:0] and INV2[2:0] in register 1Eh (see Table 30). When no input is selected the inverter is powered down.

## ANALOGUE AUDIO OUTPUTS

The following sections give an overview of the analogue audio output pins. The WM9713L has three outputs capable of driving loads down to  $16\Omega$  (headphone / line drivers) – HPL, HPR and MONO - and four output capable of driving loads down to  $8\Omega$  (loudspeaker / line drivers) – SPKL, SPKR, OUT3 and OUT4. The combination of output drivers, mixers and mixer inverters means that many output configurations can be supported.

For examples of typical output and mixer configurations please refer to the “Typical Output Configurations” section. For more information on recommended external components, please refer to the “Applications Information” section.

Each output is driven by a PGA with a gain range of 0dB to -46.5dB in -1.5dB steps. Each PGA has an input source mux, mute and zero-cross detect circuit (delaying gain changes until a zero-cross is detected, or after time-out).

## HEADPHONE OUTPUTS – HPL AND HPR

The HPL and HPR outputs (pins 39 and 41) are designed to drive a  $16\Omega$  or  $32\Omega$  headphone load. They can also be used as line outputs. They can be used in and AC coupled or DC coupled (capless) configuration. The available input sources are HPMIXL/R and Vmid (see Table 31).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
1Ch Output PGA Mux Select	7:6	HPL	00 (Vmid)	HPL input source select 00: Vmid 01: no i/p ( $Z_H$ if buffer disabled) 10: HPMIXL 11: unused
	5:4	HPR	00 (Vmid)	HPR input source select 00: Vmid 01: no i/p ( $Z_H$ if buffer disabled) 10: HPMIXR 11: unused

**Table 31 HPL / HPR PGA Input Source**

The signal volume on HPL and HPR can be independently adjusted under software control by writing to register 04h.

When not in use HPL and HPR can be powered down using the Powerdown register bits HPL and HPR (register 3Eh, bits [10:9]). To minimise pops and clicks when the PGA is powered down / up it is recommended that the Vmid input is selected during the power down / up cycle. This ensures the same DC level is maintained on the output pin throughout.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

## SPEAKER OUTPUTS – SPKL AND SPKR

The SPKL and SPKR (pins 35 and 36) are designed to drive a loudspeaker load down to 8Ω and can also be used as line outputs and headphone outputs. They are designed to drive an 8Ω load AC coupled or in a BTL (capless) configuration. The available input sources are HPMIXL/R, SPKMIXL/R, INV1/2 and Vmid (see Table 35).

Table 36 SPKL / SPKR PGA Control

**Note:**

- For BTL speaker drive, it is recommended that both PGAs have the same gain setting.

## AUXILIARY OUTPUTS – OUT3 AND OUT4

The OUT3 and OUT4 outputs (pins 37 and 33) are designed to drive a loudspeaker load down to 8Ω and can also be used as line outputs and headphone outputs. They are designed to drive an 8Ω load AC coupled or in a BTL (capless) configuration and can be used as a midrail buffer to drive the headphone outputs in a capless DC configuration. The available input sources are INV1/2 and Vmid (see Table 37).

Table 38 OUT3 / OUT4 PGA Control

## THERMAL SENSOR

The speaker and headphone outputs can drive very large currents. To protect the WM9713L from becoming too hot, a thermal sensor has been built in. If the chip temperature reaches approximately 150°C, and the ENT bit is set, the WM9713L deasserts GPIO bit 11 in register 54h, a virtual GPIO that can be set up to generate an interrupt to the CPU (see “GPIO and Interrupt Control” section).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
3Ch	13	TSHUT	1	Power down thermal sensor 0: Enabled 1: Disabled
54h	11	TI	0	Thermal sensor (virtual GPIO) 1: Temperature below 150°C 0: Temperature above 150°C See also “GPIO and Interrupt Control” section.

Table 39 Thermal Cutout Control

## JACK INSERTION AND AUTO-SWITCHING

In a phone application, a BTL ear speaker may be connected across MONO and HPL, a stereo headphone on HPL and HPR and stereo speakers on SPKL, SPKR, OUT3 and OUT4 (see Figure 15). Typically, only one of these three output devices is used at any given time: when no headphone is plugged in, the BTL ear speaker or stereo speakers are active, otherwise the headphone is used.

**Figure 15 Typical Output Configuration**

The presence of a headphone can be detected using one of GPIO1/6/7/8 (pins 44, 3, 11 & 12) and an external pull-up resistor (see "Applications Information" section for a circuit diagram). When the jack is inserted the GPIO is pulled low by a switch on the socket. When the jack is removed the GPIO is pulled high by a resistor. If the JIEN bit is set, the WM9713L automatically switches between headphone and any other output configuration, typically ear speaker or stereo speaker that has been set up in the Powerdown and Output PGA Mux Select registers.

**Note:** The GPIO polarity can be inverted by setting register 4Eh.

In addition to the typical configuration explained above the WM9713L can also support automatic switching between the following three configurations set as BTL ear speaker and headphone.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
24h Output Volume Mapping (Jack Insert)	1:0	EARSPKSEL	00	00: Default, no ear speaker configuration selected. 01: MONO and HPL driver selected as BTL ear speaker. 10: OUT3 and HPL driver selected as BTL ear speaker. 11: OUT4 and HPL driver selected as BTL ear speaker.

**Table 40 Ear Speaker Configuration**

For example if OUT4 and HPL is selected as the BTL ear speaker, the user should select EARSPKSEL = 3h, then OUT4 is tri-stated on jack insert to prevent sound across the ear speaker during headphone operation and HPL volume is set to OUT4 volume on jack out to ensure correct ear speaker operation. It should be noted that all other outputs except HPL, HPR and selected ear speaker driver are disabled and internally connected to VREF on jack insert. This maintains VREF at those outputs and helps prevent pops when the outputs are enabled.

Finally if the user wishes to DC couple the headphone outputs the user needs to select between OUT3 and OUT4 as the mid-rail output buffer driver. The selected mid-rail output buffer is enabled on jack insert. On jack out it defaults to whatever configuration has been set up in the Powerdown and Output PGA Mux Select registers.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
24h Output Volume Mapping (Jack Insert)	3:2	DCDRVSEL	00	00: Default, AC coupled headphone. 01: OUT4 as mid-rail output buffer. 11: OUT3 as mid-rail output buffer.

**Table 41 DC Coupled Headphone Configuration**

In summary:

JIEN not set: Outputs work as normal as selected in the Powerdown and Output PGA Mux Select registers.

JIEN set: On jack insert GPIO1/6/7/8 is pulled low, HPL and HPR are enabled, DCDRVSEL decides if the headphones are DC or AC coupled and configures OUT3 or OUT4 to suit, EARSPKSEL decides if MONO, OUT3 or OUT4 need to be tri-stated to ensure no sound out on the ear-speaker and finally all other outputs are disabled as explained above to prevent pops on re-enabling.

On jack out GPIO1/6/7/8 is pulled high, the outputs work as normal as selected in the Powerdown and Output PGA Mux Select registers except that HPL Volume is controlled by EARSPKSEL to ensure correct ear speaker operation.

Table 43 Jack Insertion / Auto-Switching (2)

## DIGITAL AUDIO (SPDIF) OUTPUT

The WM9713L supports the SPDIF standard. Pins 48 & 12 can be used to output the SPDIF data. Note that pins 48 & 12 can also be used as GPIO pins. The GE5 & GE8 bits (register 56h, bit 5 & bit 8) select between GPIO and SPDIF functionality for pins 48 & 12 respectively (see "GPIO and Interrupt control" section).

Register 3Ah is a read/write register that controls SPDIF functionality and manages bit fields propagated as channel status (or sub-frame in the V case). With the exception of V, this register should only be written to when the SPDIF transmitter is disabled (SPDIF bit in register 2Ah is '0'). Once the desired values have been written to this register, the contents should be read back to ensure that the sample rate in particular is supported, then SPDIF validity bit SPCV in register 2Ah should be read to ensure the desired configuration is valid. Only then should the SPDIF enable bit in register 2Ah be set. This ensures that control and status information start up correctly at the beginning of SPDIF transmission.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
2Ah Extended Audio	10	SPCV	0	SPDIF validity bit (read-only)
	5:4	SPSA	01	SPDIF slot assignment (ADCO = 0) 00: Slots 3, 4 01: Slots 6, 9 10: Slots 7, 8 11: Slots 10, 11

5Ch Additional Function Control	4	ADCO	0	Source of SPDIF data 0: SPDIF data comes from SDATAOUT (pin 5), slot selected by SPSA 1: SPDIF data comes from audio ADC

**Table 44 SPDIF Output Control**

## TOUCHPANEL INTERFACE

The WM9713L includes a touchpanel driver and digitiser circuit for use with 4-wire or 5-wire resistive touchpanels. The following functions are implemented:

- X co-ordinate measurement
- Y co-ordinate measurement
- Pen down detection, with programmable sensitivity
- Touch pressure measurement (4-wire touchpanel only)
- Auxiliary measurement from COMP1/AUX1 (pin 29), COMP2/AUX2 (pin 30), BMON/AUX3 (pin 31), or WIPER/AUX4 (pin 12)

The touchpanel digitiser uses a very low power, 12-bit successive approximation type ADC. The same ADC can also be used for battery and auxiliary measurements (see the "Battery Alarm and Battery Measurement" and "Auxiliary ADC Inputs" sections).

An on-chip switch matrix connects each touchpanel terminal to the supply voltage TPVDD, to ground (TPGND), or to the ADC input, as required.

Figure 16 Touchpanel Switch Matrix

## PRINCIPLE OF OPERATION - FOUR-WIRE TOUCHPANEL

Four-wire touchpanels are connected to the WM9713L as follows:

- Right side contact = X+ (pin 14)
- Left side contact = X- (pin 16)
- Top side contact = Y+ (pin 15)
- Bottom side contact = Y- (pin 17)

The principle of operation is illustrated below (Note: the illustrations assume that the top plate is used for X and the bottom plate for Y measurements, although the reverse is also possible).

**Figure 17 X Co-ordinate Measurement on 4-wire Touchpanel**

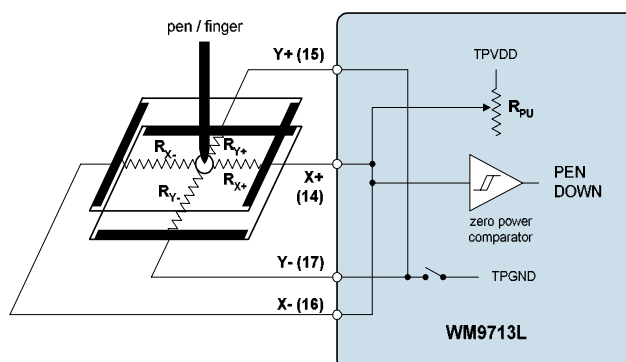

For an X co-ordinate measurement, the X+ pin is internally switched to VDD and X- to GND. The X plate becomes a potential divider, and the voltage at the point of contact is proportional to its X co-ordinate. This voltage is measured on the Y+ and Y- pins, which carry no current (hence there is no voltage drop in  $R_{Y+}$  or  $R_{Y-}$ ).

Due to the ratiometric measurement method, the supply voltage does not affect measurement accuracy. The voltage references  $V_{REF+}$  and  $V_{REF-}$  are taken from after the matrix switches, so that any voltage drop in these switches has no effect on the ADC measurement.

**Figure 18 Y Co-ordinate Measurement on 4-wire Touchpanel**

Y co-ordinate measurements are similar to X co-ordinate measurements, with the X and Y plates interchanged.

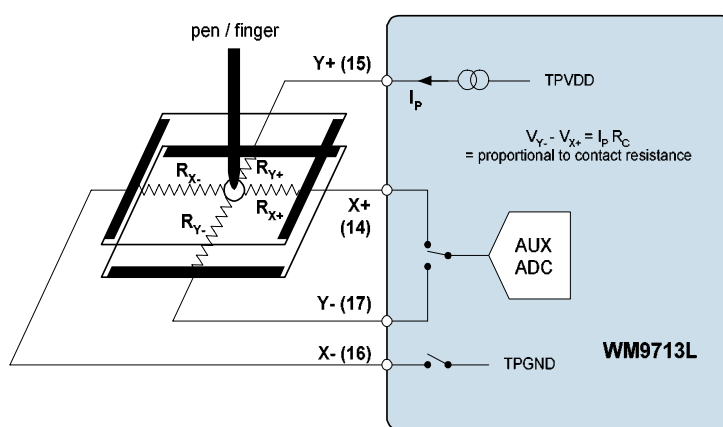

**Figure 19 Pen Down Detection on 4-wire Touchpanel**

Pen down detection uses a zero power comparator (effectively a CMOS logic gate) with an internal, programmable pull-up resistor  $R_{PU}$  that controls pen-down sensitivity. Increasing  $R_{PU}$  makes the touchpanel less sensitive to touch, while lowering  $R_{PU}$  makes it more sensitive.

When the touchpanel is not being touched, no current flows in the circuit, and the PENDOWN signal is low. When the panel is touched with a pen or finger, current flows through  $R_{PU}$  and the panel, and the comparator output goes high.

The PENDOWN signal can be read from bit 15 in register 7Ah (labeled PNDN). It can also be observed on pin 46 (GPIO3 / PENDOWN), if the pin is not used for GPIO (GE3=0). Additionally, PENDOWN is passed to the GPIO logic block (register 54h, bit 13), where it can generate CPU interrupts, and / or to wake up the WM9713L from sleep mode (see "GPIO and Interrupt Control" section).

**Figure 20 Touch Pressure Measurement on 4-wire Touchpanel**

Touch pressure can be determined indirectly by measuring the contact resistance  $R_C$  between the top and bottom plates.  $R_C$  decreases as the touch pressure on the panel increases. The WM9713L measures  $R_C$  by sending a constant current  $I_P$  through the touchpanel and measuring the potential on each plate. The two values are subtracted in the digital domain to obtain the potential difference, which is proportional to  $R_C$ .

To suit different types of touchpanels, the magnitude of  $I_P$  can be set to either 400 $\mu$ A or 200 $\mu$ A using the PIL control bit.

## PRINCIPLE OF OPERATION - FIVE-WIRE TOUCHPANEL

Five-wire touchpanels are connected to the WM9713L as follows:

- Top sheet contact = WIPER/AUX4 (pin 12)
- Top left corner of bottom sheet = TL (pin 16)
- Top right corner of bottom sheet = TR (pin 15)
- Bottom left corner of bottom sheet = BL (pin 17)
- Bottom right corner of bottom sheet = BR (pin 14)

**Figure 21 X Co-ordinate Measurement on 5-wire Touchpanel**

For an X co-ordinate measurement, the top left and bottom left corners of the touchpanel are grounded internally to the WM9713L, while the top right and bottom right contacts are connected to TPVDD. The bottom plate becomes a potential divider with a voltage gradient in the X direction. The voltage at the point of contact is proportional to its X co-ordinate. This voltage is measured on the WIPER pin and converted to a digital value by the ADC.

Due to the ratiometric measurement method, the supply voltage does not affect measurement accuracy. The voltage references VREF+ and VREF- are taken from after the matrix switches, so that any voltage drop in these switches has no effect on the ADC measurement.

**Figure 22 Y Co-ordinate Measurement on 5-wire Touchpanel**

Y co-ordinate measurements are similar to Y co-ordinate measurements. However, the voltage gradient on the bottom plate is in the Y direction instead of the X direction. This is achieved by grounding the bottom left and bottom right corners of the touchpanel, and connecting the top left and top right contacts to TPVDD.

**Figure 23 Pen Down Detection on 5-wire Touchpanel**

Pen down detection works in a similar fashion for both 4-wire and 5-wire touchpanels (see Four-Wire Touchpanel Operation). On a 5-wire touchpanel, all four contacts of the bottom plate are grounded, and the top plate contact is connected to the internal programmable pull-up resistor,  $R_{PU}$ .

## CONTROLLING THE TOUCHPANEL DIGITISER

All touchpanel functions are accessed and controlled through the AC-Link interface.

### PHYSICAL CHARACTERISTICS

The physical characteristics of the touchpanel interface are controlled through register 78h, as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
78h	12	45W	0 (4-wire)	Touchpanel Type Selection 0: 4-wire 1: 5-wire

**Table 45 Touchpanel Digitiser Control (Physical Characteristics)**

**POWER MANAGEMENT**

To save power, the touchpanel digitiser and the pen-down detector can be independently disabled when they are not used. The power consumption of the pen-down detector is normally negligible, except when the pen is down.

The pen ADC is powered-down using PADCPD, register 3Ch bit 15.

The state of the digitiser and pen down detector is controlled by the following bits.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
3Ch	15	PADCPD	1 = off	Pen ADC power down
78h	15:14	PRP	00	Pen ADC/AUX ADC enable 00 – Pen digitiser off, pen detect off, no wake-up on pen down (default) 01 – Pen digitiser powered off, pen detect enabled, touchpanel digitiser wakes up (changes to state 11) on pen-down 10 – Pen digitiser off, pen detect enabled, no wake-up on pen down 11 – Pen digitiser and pen detect enabled
	13	RPR	0	Wake-up on pen-down mode 0: Wake-up the AC-Link only (hold SDA <sub>TA</sub> IN high until controller sends warm reset or cold reset) 1: Wake-up the WM9713L without waiting for a reset signal from the controller

**Table 46 Touchpanel Digitiser Control (Power Management)**

### INITIATION OF MEASUREMENTS

The WM9713L touchpanel interface supports both polling routines and DMA (direct memory access) to control the flow of data from the touchpanel ADC to the host CPU.

In a polling routine, the CPU starts each measurement individually by writing to the POLL bit (register 74h, bit 9). This bit automatically resets itself when the measurement is completed.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
74h	9	POLL	0	Writing "1" initiates a measurement. (when CTC is not set)
	8	CTC	0	0: Polling mode 1: Continuous mode (for DMA)
76h	9:8	CR	00	Continuous mode rate (DEL 1111) 00: 93.75 Hz (every 512 AC-Link frames) 01: 120 Hz (every 400 AC-Link frames) 10: 153.75 Hz (every 312 AC-Link frames) 11: 187.5Hz (every 256 AC-Link frames) Continuous mode "fast rate" (DEL = 1111) 00: 8 kHz (every six AC-Link frames) 01: 12 kHz (every four AC-Link frames) 10: 24 kHz (every other AC-Link frame) 11: 48 kHz (every AC-Link frame)
78h	11	PDEN	0	0: measure regardless of pen status 1: measure only when pen is down (when CTC=0 and POLL=1, measurement is delayed until pen-down; when CTC=1, measurements are stopped on pen-up)
	10	PDPOL	0	Sets polarity of PENDOWN flag: 0: non-inverted 1: inverted

**Table 47 Touchpanel Digitiser Control (Initiation of Measurements)**

In continuous mode (CTC = 1), the WM9713L autonomously initiates measurements (or sets of measurements) at the rate set by CR, and supplies the measured data to the CPU on one of the unused AC'97 time slots. DMA-enabled CPUs can write the data directly into a FIFO without any intervention by the CPU core. This reduces CPU loading and speeds up the execution of user programs in handheld systems.

Note that the measurement frequency in continuous mode is also affected by the DEL bits (see "Touchpanel Settling Time"). The faster rates achieved when DEL = 1111 may be useful when the ADC is used for auxiliary measurements.

**MEASUREMENT TYPES**

The ADCSEL control bits determine which type of measurement is performed (see below).

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
74h	9	POLL	0	Writing "1" initiates a measurement. (when CTC is not set)
	8	CTC	0	0: Polling mode 1: Continuous mode (for DMA)
	7	ADCSEL_AUX4	0	Enable COMP1/AUX4 measurement (pin32)
	6	ADCSEL_AUX3	0	Enable COMP1/AUX3 measurement (pin31)
	5	ADCSEL_AUX2	0	Enable COMP1/AUX2 measurement (pin30)
	4	ADCSEL_AUX1	0	Enable COMP1/AUX1 measurement (pin29)
	3	ADCSEL_PRESSURE	0	Enable touchpanel pressure measurement
	2	ADCSEL_Y	0	Enable touchpanel Y co-ord measurement
	1	ADCSEL_X	0	Enable touchpanel X co-ord measurement
	0	COO	0	Enable co-ordinate mode 0: Single measurement. A single measurement is made depending on the setting of ADCSEL[7:1]. 1: Co-ordinate measurement. X, then Y, followed by an additional measurement indicated by ADCSEL[7:1]. If more than one ADCSEL[7:1] bit is selected then the third, additional, measurement will alternate sequentially between those selected.

**Table 48 Touchpanel Digitiser Control (Measurement Types)**

When COO is '0', the WM9713L performs a single measurement – either in polling mode or continuously, as indicated by the CTC bit. The type of measurement is specified by the ADCSEL[7:1] bits. If CTC=0 (polling mode) then only one of the ADCSEL[7:1] bits should be set.

If operating in continuous mode (CTC=1), then more than one ADCSEL[7:1] bit may be set and selected conversions will be performed cyclically in the following order => "X,Y,PRESSURE,AUX1,AUX2,AUX3,AUX4..."

The co-ordinate mode (COO = '1') makes it easier to obtain co-ordinate pairs rather than single co-ordinates. In polling-coordinate mode (CTC = '0', COO = '1'), the WM9713L performs an X co-ordinate, then a Y co-ordinate, followed by a single additional measurement determined by ADCSEL[7:1], then stops. In continuous-coordinate mode (CTC = '1', COO = '1'), the WM9713L continuously repeats a sequence consisting of an X-co-ordinate, Y co-ordinate, then an additional measurement determined by ADCSEL[7:1] (if ADCSEL = 000\_0000, the sequence is XYXYXY... only). Should more than one of the ADCSEL[7:1] bits be set during continuous co-ordinate mode then the additional measurement alternates for every set of three measurements. For example if ADCSEL\_AUX1 and ADCSEL\_AUX3 were both selected whilst CTC = '1', COO = '1' then the following sequence of conversions would be performed => "X,Y,AUX1,X,Y,AUX3,X,Y,AUX1,X,Y,AUX3..."

### CONVERSION RATE

As stated previously the conversion rate is specified by the CR bits (reg 76h).

CR may be set to 93.75Hz (every 512 AC-Link Frames), 120Hz (every 400 AC-Link Frames), 153.75Hz (every 312 AC-Link frames) or 187.5Hz (every 256 AC-Link frames).

If only one ADRSEL[7:1] bit is set then each individual conversion occurs at the rate specified by CR.

If multiple ADRSEL[7:1] bits are set then the complete set of conversions requested is completed at the rate specified by CR.

### DATA READBACK

This data is stored in register 7Ah, and can be retrieved by reading the register in the usual manner (see AC-Link Interface section). Additionally, the data can also be passed to the controller on one of the AC-Link time slots not used for audio functions.

The output data word of the touchpanel interface consists of three parts:

- Pen Status (1 bit) – this is also passed to the GPIO logic block, which can be programmed to generate an interrupt and/or wake up the WM9713L on pen down (see GPIO and Interrupt Control).
- Output data from the touchpanel ADC (12 bits)
- ADCSRC: 3 additional bits that indicate the source of the ADC data. In co-ordinate mode (COO = '1'), the WM9713L schedules different types of measurements autonomously and so these register bits may be required.

If the data is being read back using the polling method, there are several ways to determine when a measurement has finished:

- Reading back the POLL bit. If it has been reset to '0', then the measurement has finished.
- Monitoring the ADA signal, see GPIO and interrupt section. ADA goes high after every single conversion. If operating in co-ordinate mode (COO=1) then ADA goes high after every group of 3 conversions.
- Reading back 7Ah until the new data appears

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
7Ah or AC-Link slot selected by SLT	15	PNDN	0	Pen status (read-only) 0: Pen Up 1: Pen Down
	14:12	ADCSRC	000	Touchpanel ADC Source 000: No measurement 001: X co-ordinate measurement 010: Y co-ordinate measurement 011: Pressure measurement (4-wire only) 100: COMP1/AUX1 measurement (pin 29) 101: COMP2/AUX2 measurement (pin 30) 110: BMON/AUX3 measurement (pin 31) 111: WIPER/AUX4 measurement (pin 12)
	11:0	ADCD	000h	Touchpanel ADC Data (read-only) Bit 11 = MSB Bit 0 = LSB
78h	9	WAIT	0	0: No effect (new ADC data overwrites unread data in register 7Ah) 1: New data is held back, and measurements delayed, until register 7Ah is read)

**Table 49 Touchpanel Digitiser Data**

When operating in co-ordinate mode (COO=1) there will be 3 results to read back from each set of measurements – namely X,Y and the third additional measurement. After the co-ordinate set has finished the X result will be present in register 7Ah. Once this has been read back by the user the Y result will overwrite register 7Ah, as indicated by ADCSRC. Finally, after the Y result has been read back, the result of the third, additional, measurement will become present in 7Ah, again indicated by ADCSRC.

To avoid losing data that has not yet been read, the WM9713L can delay overwriting register 7Ah with new conversions until the old data has been read. This function is enabled using the WAIT bit, and applies to both single and co-ordinate conversion mode.

The flow diagram in Figure 24 shows the timing of touchpanel conversions, and data readback from register 7Ah - dependent on the individual settings of the CO, POLL, ADCSEL and CTC bits.

POLL (74h)	Starts a single measurement
CTC (74h)	Starts a co-ordinate measurement at specified conversion rate
COO (74h)	Enables Co-Ordinate mode
ADCSEL (74H)	Specifies the type of measurement to be made

**Figure 24 Touchpanel Conversion Flow Diagram**

If the SLEN bit is set to '1', then the touchpanel data appears on the AC-Link slot selected by the SLT control bits, as shown below. The Slot 0 'tag' bit corresponding to the selected time slot is asserted whenever there is new data on that slot.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
76h	3	SLEN	0	Slot Readback Enable 0: Disabled (readback through register only) 1: Enable (readback slot selected by SLT)
	2:0	SLT	110	AC'97 Slot Selection for Touchpanel Data 000: Slot 5 001: Slot 6 ... 101: Slot 10 110: Slot 11 111: RESERVED

**Table 50 Returning Touchpanel Data Through an AC-Link Time Slot**

**TOUCHPANEL SETTling TIME**

For accurate touchpanel measurements, some settling time may be required between the switch matrix applying a voltage across the touchpanel plate and the ADC sampling the signal. This time delay function is built into the WM9713L and can be programmed as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
76h	7:4	DEL	0000 (1 frame)	Touchpanel ADC Settling Time

**Table 51 Touchpanel Settling Time Control (1)**

DEL	DELAY (AC-LINK FRAMES)	DELAY (TIME)
0000	1	20.8µs
0001	2	41.7µs
0010	4	83.3µs
0011	8	167µs
0100	16	333µs
0101	32	667µs
0110	48	1ms
0111	64	1.33ms
1000	96	2ms
1001	128	2.67ms
1010	160	3.33ms
1011	192	4ms
1100	224	4.67ms
1101	256	5.33ms
1110	288	6ms
1111	No delay, switch matrix always on	

**Table 52 Touchpanel Settling Time Control (2)**

The total time for co-ordinate or auxiliary measurements to complete is the delay time DEL, plus one AC-Link frame (20.8µs). For a pressure measurement, the time taken is DEL plus two AC-Link frames (41.6µs).

Although the DELAY is variable the maximum value that may be programmed depends on the number of ADCSEL[7:1] bits set, as shown in the following table. Setting multiple ADCSEL[7:1] bits leaves less spare AC\_Link frames for the DELAY.

NUMBERS OF ADCSEL[1:7] BITS SET	CR SETTING	MAX DELAY SETTING
1	00 (93.75Hz)	288
1	01 (120Hz)	288
1	10 (153.75Hz)	288
1	11 (187.5Hz)	256
2	00 (93.75Hz)	256
2	01 (120Hz)	192
2	10 (153.75Hz)	128
2	11 (187.5Hz)	128
3, 4	00 (93.75Hz)	96
3, 4	01 (120Hz)	96
3, 4	10 (153.75Hz)	64
3, 4	11 (187.5Hz)	48
5,6,7	00 (93.75Hz)	48
5,6,7	01 (120Hz)	48
5,6,7	10 (153.75Hz)	32
5,6,7	11 (187.5Hz)	16
1 (if COO=1)	00 (93.75Hz)	224
1 (if COO=1)	01 (120Hz)	192
1 (if COO=1)	10 (153.75Hz)	128
1 (if COO=1)	11 (187.5Hz)	96
2,3,4,5,6,7 (if COO=1)	00 (93.75Hz)	160
2,3,4,5,6,7 (if COO=1)	01 (120Hz)	128
2,3,4,5,6,7,8 (if COO=1)	10 (153.75Hz)	96
2,3,4,5,6,7,8 (if COO=1)	11 (187.5Hz)	64

**Table 53 Maximum Delay Values**

Setting DEL to '1111' reduces the settling time to zero, i.e. measurements begin immediately. This mode is intended for fast sampling on AUX inputs. It is NOT intended for touchpanel digitisation. There are several side-effects when DEL is set to '1111':

- Co-ordinate mode does not work, i.e. the WM9713L behaves as if COO = 0, even if COO = 1 (see "Measurement Types")
- If X / Y co-ordinate or touch pressure measurements are selected (ADCSEL = 001, 010 or 011), then the switch matrix is constantly on, and current constantly flows in the touchpanel. This increases power consumption in the system, and is therefore not recommended for battery powered systems
- In continuous mode (CTC = 1), setting DEL = 1111 increases the sampling rate of the touchpanel ADC (see "Initiation of Measurements")

## MASK INPUT CONTROL

Sources of glitch noise, such as the signals driving an LCD display, may feed through to the touchscreen plates and affect measurement accuracy. In order to minimise this effect, a signal may be applied to MASK (pin 47 / pin 3) to delay or synchronise the sampling of any input to the ADC. The effect of the MASK signal depends on the the MSK bits of register 78h (bits [7:6]), as described below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
78h	7:6	MSK	00	MASK input control (see Table 55)

**Table 54 MASK Input Control**

MSK[1-0]	EFFECT OF SIGNAL ON MASK PIN
00	Mask has no effect on conversions GPIO input disabled (default)
01	Static; 'hi' on MASK pin stops conversions, 'lo' has no effect.
10	Edge triggered; rising or falling edge on MASK pin delays conversions by an amount set in the DEL[3-0] register. Conversions are asynchronous to the MASK signal.
11	Synchronous mode; conversions wait until rising or falling edge on MASK initiates cycle; screen starts to be driven when the edge arrives, the conversion sample being taken a period set by DEL[3-0] after the edge.

**Table 55 Controlling the MASK Feature**

Note that pin 47 / pin 3 can also be used as a GPIO(see "GPIO and Interrupt Control" section), or to output the ADA signal (see below).

## THE ADA SIGNAL

Whenever data becomes available from the touchpanel ADC, the internal ADA (ADC Data Available) signal goes high and remains high until the data has been read from register 7Ah (if SLEN = 0) or until it has been sent out on an AC-Link slot (if SLEN = 1).

ADA goes high either-

- After every touchpanel ADC conversion (in normal mode, COO=0)
- After every set of 3 conversions (co-ordinate mode, COO=1)

ADA can be used to generate an interrupt, if the AW bit (register 52h, bit 12) is set (see "GPIO and interrupt control" section)

It is also possible to output the ADA signal on pin 47 / pin 3, if this pin is not used as a GPIO. The GE4/6 bit must be set to '0' to achieve this (see "GPIO and interrupt control" section).

Alternatively, ADA can be read from bit 12 in register 54h.

## ADDITIONAL FEATURES

### AUXILIARY ADC INPUTS

The ADC used for touchpanel digitisation can also be used for the sole purpose of auxiliary measurements, provided that it is enabled (register 78h, PRP = 11). The WM9713L has three pins that can be used as auxiliary ADC inputs:

- MIC2A / COMP1 / AUX1 (pin 29)
- MIC2B / COMP2 / AUX2 (pin 30)
- WIPER / AUX4 (pin 12)

Additionally, the speaker supply (SPKVDD) can be used as an auxiliary ADC input through an on-chip potential divider giving an input to the auxiliary ADC of SPKVDD/3. This input is referred to as the AUX3 input (see Figure 16).

Note that pin 12 connects to the wiper of a 5-wire touchpanel wiper function. Auxiliary measurements taken on pin 12 are only meaningful when it is not connected to a touchpanel (i.e. a 4-wire touchpanel, or no touchpanel at all, is used). Pins 29 and 30 are also used as comparator inputs (see Battery Alarm and Battery Measurement), but auxiliary measurements can still be taken on these pins at any time. The ADCSEL control bits select between different ADC inputs, as shown in Table 56.

The ADCSEL control bits determine which type of measurement is performed (see below). When performing auxiliary conversions the co-ordinate mode bit, COO, should be off (0).

If CTC=0 then only one of the ADCSEL[7:1] bits should be set. If operating in continuous mode (CTC=1), then more than one ADCSEL[7:1] bit may be set, and conversions will be performed cyclically in the following order => "AUX1,AUX2,AUX3,AUX4..." – dependent on which bits are set.

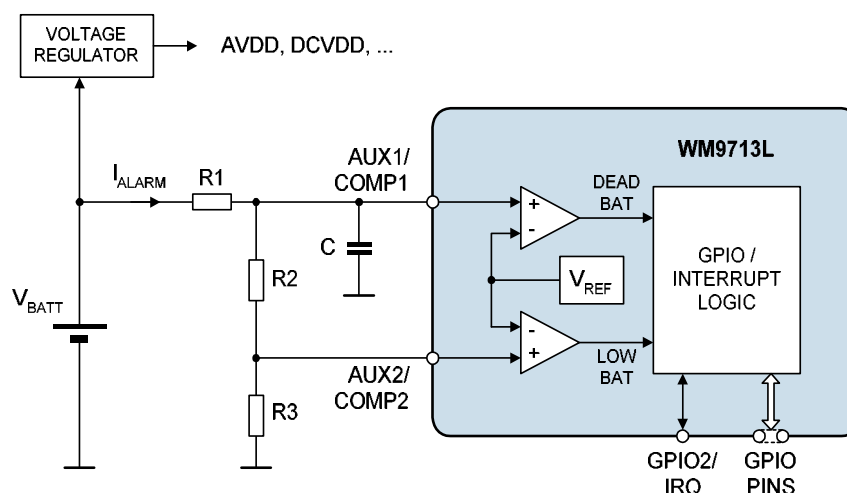

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
74h	7	ADCSEL_AUX4	0	Enable AUX4 measurement (pin12)
	6	ADCSEL_AUX3	0	Enable AUX3 measurement (SPKVDD)
	5	ADCSEL_AUX2	0	Enable AUX2 measurement (pin30)
	4	ADCSEL_AUX1	0	Enable AUX1 measurement (pin29)
	0	COO	0	Enable co-ordinate mode – for touchpanel conversions only (see "Controlling the Touchpanel Interface")

**Table 56 Auxiliary ADC Measurements**

Auxiliary ADC measurements are initiated in the same way as touchpanel measurements, and the data is returned in the same manner. Please refer to the "Controlling the Touchpanel Interface" section.

## BATTERY ALARM AND ANALOGUE COMPARATORS

The battery alarm function differs from battery measurement in that it does not actually measure the battery voltage. Battery alarm only indicates “OK”, “Low” or “Dead”. The advantage of the battery alarm function is that it does not require a clock and can therefore be used in low-power sleep or standby modes.

**Figure 25 Battery Alarm Example Schematic**

The typical schematic for a dual threshold battery alarm is shown above. This alarm has two thresholds, “dead battery” (COMP1) and “low battery” (COMP2). R1, R2 and R3 set the threshold voltages. Their values can be up to about 1MΩ in order to keep the battery current [ $I_{ALARM} = V_{BATT} / (R1+R2+R3)$ ] to a minimum (higher resistor values may affect the accuracy of the system as leakage currents into the input pins become significant).

Dead battery alarm: COMP1 triggers when  $V_{BATT} < V_{REF} \times (R1+R2+R3) / (R2+R3)$

A dead battery alarm is the highest priority of interrupt in the system. It should immediately save all unsaved data and shut down the system. The GP15, GS15 and GW15 bits must be set to generate this interrupt.

Low battery alarm: COMP2 triggers when  $V_{BATT} < V_{REF} \times (R1+R2+R3) / R3$

A low battery alarm has a lower priority than a dead battery alarm. Since the threshold voltage is higher than for a dead battery alarm, there is enough power left in the battery to give the user a warning and/or shut down “gracefully”. When  $V_{BATT}$  gets close to the low battery threshold, spurious alarms are filtered out by the COMP2 delay function.

The purpose of the capacitor C is to remove from the comparator inputs any high frequency noise or glitches that may be present on the battery (for example, noise generated by a charge pump). It forms a low pass filter with R1, R2 and R3.

Low pass cutoff  $f_c$  [Hz] =  $1 / (2\pi C \times (R1 \parallel (R2+R3)))$

Provided that the cutoff frequency is several orders of magnitude lower than the noise frequency  $f_n$ , this simple circuit can achieve excellent noise rejection.

Noise rejection [dB] =  $20 \log (f_n / f_c)$

The circuit shown above also allows for measuring the battery voltage  $V_{BATT}$ . This is achieved simply by setting the touchpanel ADC input to be either COMP1 (ADCSEL = 100) or COMP2 (ADCSEL = 101) (see also Auxiliary ADC Inputs).

The WM9713L has two on-chip comparators that can be used to implement a battery alarm function, or other functions such as a window comparator. Each comparator has one of its inputs tied to any one of three device pins and the other tied to a voltage reference. The voltage reference can be either internally generated ( $V_{REF} = AVDD/2$ ) or externally connected on AUX4 (pin 12).

The comparator output signals are passed to the GPIO logic block (see "GPIO and Interrupt Control" section), where they can be used to send an interrupt to the CPU via the AC-Link or via the IRQ pin, and / or to wake up the WM9713L from sleep mode. COMP1/AUX1 (pin 29) corresponds to GPIO bit 15 and COMP2/AUX2 (pin 30) to bit 14.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 58 Comparator Reference and Source Control

**COMP2 DELAY FUNCTION**

COMP2 has an optional delay function for use when the input signal is noisy. When COMP2 triggers and the delay is enabled (i.e. COMP2DEL is non-zero), then GPIO bit 14 does not change state immediately, and no interrupt is generated. Instead, the WM9713L starts a delay timer and checks COMP2 again after the delay time has passed. If COMP2 is still active, then the GPIO bit is set and an interrupt may be generated (depending on the state of the GW14 bit). If COMP2 is no longer active, the GPIO bit is not set, i.e. all register bits are as if COMP2 had never triggered.

**Figure 26 COMP2 Delay Flow Chart**

## GPIO AND INTERRUPT CONTROL

The WM9713L has eight GPIO pins that operate as defined in the AC'97 Revision 2.2 specification. Each GPIO pin can be set up as an input or as an output, and has corresponding bits in register 54h and in slot 12. The state of a GPIO output is determined by sending data through slot 12 of outgoing frames (SDATAOUT). Data can be returned from a GPIO input by reading the register bit, or examining slot 12 of incoming frames (SDATAIN). GPIO inputs can be made sticky, and can be programmed to generate an interrupt, transmitted either through the AC-Link or through a dedicated, level-mode interrupt pin (GPIO2/IRQ, pin 45).

In addition, the GPIO pins 1, 3, 4 and 5 can be used for the PCM interface by setting bit 15 of register 36h (see "PCM Codec" section). Setting this bit disables any GPIO functions selected on these pins.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
36h PCM Codec Control	15	CTRL	0	Enables PCM interface on GPIO pins 1, 3, 4 and 5. 0: Normal GPIO functions 1: PCM interface enabled
56h GPIO Pin Sharing	8:2	GE#	1 (GPIO)	Toggle GPIO pin function: 0: secondary function enabled 1: GPIO enabled

**Table 59 GPIO Additional Function Control**

GPIO pins 2 to 8 are multi-purpose pins that can also be used for other (non-GPIO / -PCM) purposes, e.g. as a SPDIF output or to signal pendown. This is controlled by register 56h.

Note that GPIO6/7/8 each have an additional function independent of the GPIO / auxillary functions discussed above. If these pins are to be used as GPIO then the independent function needs to be disabled using its own control registers, e.g. to use pin 11 as a GPIO then the RESETB function needs to be disabled (RSTDIS, register 5Ah, bit 8).

Independently of the GPIO pins, the WM9713L also has seven virtual GPIOs. These are signals from inside the WM9713L, which are treated as if they were GPIO input signals. From a software perspective, virtual GPIOs are the same as GPIO pins, but they cannot be set up as outputs, and are not tied to an actual pin. This allows for simple, uniform processing of different types of signals that may generate interrupts (e.g. pen down, battery warnings, jack insertion, high-temperature warning, or GPIO signals).

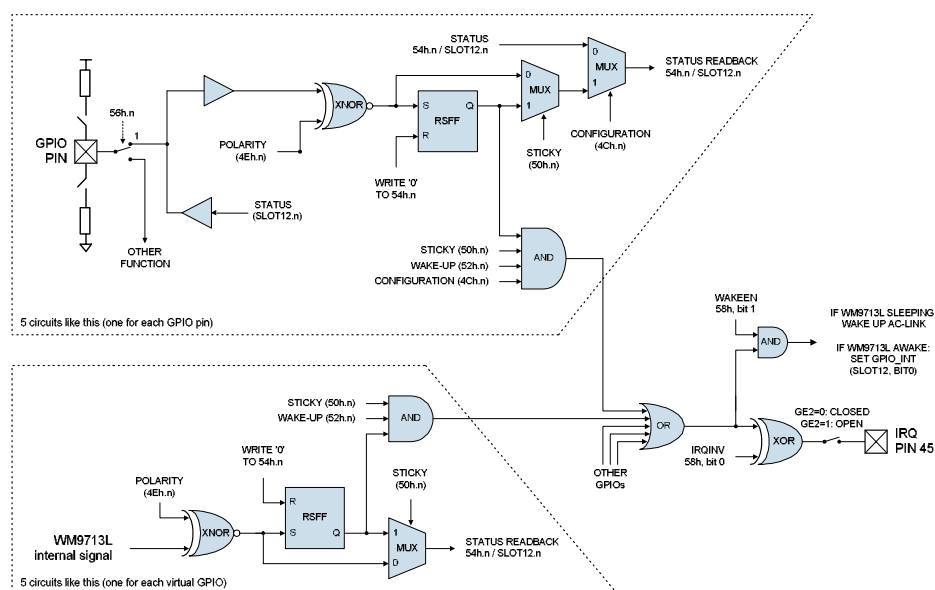

Figure 27 GPIO Logic

GPIO BIT	SLOT 12 BIT	TYPE	PIN NO.	DESCRIPTION
1	5	GPIO Pin	44	GPIO1
2	6	GPIO Pin	45	GPIO2 / IRQ enabled only when pin not used as IRQ
3	7	GPIO Pin	46	GPIO3 / PENDOWN enabled only when pin not used as PENDOWN
4	8	GPIO Pin	47	GPIO4 / ADA / MASK enabled only when pin not used as ADA
5	9	GPIO Pin	48	GPIO5 / SPDIF_OUT enabled only when pin not used as SPDIF_OUT
6	10	GPIO Pin	3	GPIO6 / ADA / MASK Enabled only when pin not used as ADA
7	11	GPIO Pin	11	GPIO7 / PENDOWN enabled only when pin not used as PENDOWN
8	12	GPIO Pin	12	GPIO8 / SPDIF_OUT enabled only when pin not used as SPDIF_OUT
9	13	Virtual GPIO	- [MICDET]	Internal microphone bias current detect, generates an interrupt above a threshold (see MICBIAS Current Detect)
10	14	Virtual GPIO	- [MICSHT]	Internal shorted microphone detect, generates an interrupt above a threshold (see MICBIAS Current Detect)
11	15	Virtual GPIO	- [Thermal Cutout]	Internal thermal cutout signal, indicates when internal temperature reaches approximately 150°C (see "Thermal Sensor")
12	16	virtual GPIO	- [ADA]	Internal ADA (ADC Data Available) Signal enabled only when touchpanel ADC is active
13	17	Virtual GPIO	- [PEN DOWN]	Internal PENDOWN Signal enabled only when pen-down detection is active
14	18	Virtual GPIO	- [COMP2]	Internal COMP2 output (Low Battery Alarm) enabled only when COMP2 is on
15	19	Virtual GPIO	- [COMP1]	Internal COMP1 output (Dead Battery Alarm) enabled only when COMP1 is on

Table 60 GPIO Bits and Pins

**Note:** GPIO7 (Pin 11) has an independent RESETB function. This must be disabled using RSTDIS (Register 5Ah, bit 8) before using Pin 11 as a GPIO / PENDOWN.

The properties of the GPIOs are controlled through registers 4Ch to 52h, as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
4Ch	n	GCn	1	GPIO Pin Configuration 0: Output 1: Input GC9-15 are always '1'
4Eh	n	GPn	1	GPIO Pin Polarity / Type
				Input (GCn=1)
				Output (GCn=0)
				0: Active Low 1: Active High [GIn = pin level XNOR GPn]
50h	n	GSn	0	GPIO Pin Sticky 1: Sticky 0: Not Sticky
52h	n	GWn	0	GPIO Pin Wake-up 1: Wake Up (generate interrupts from this pin) 0: No wake-up (no interrupts generated)
54h	n	GIn	N/A	GPIO Pin Status Read: Returns status of each GPIO pin Write: Writing '0' clears sticky bit

**Table 61 GPIO Control**

The following procedure is recommended for handling interrupts:

When the controller receives an interrupt, check register 54h. For each GPIO bit in descending order of priority, check if the bit is '1'. If yes, execute corresponding interrupt routine, then write '0' to corresponding bit in 54h. If no, continue to next lower priority GPIO. After all GPIOs have been checked, check if interrupt still present or no. If yes, repeat procedure. If no, then jump back to process that ran before the interrupt.

If the system CPU cannot execute such an interrupt routine, it may be preferable to switch internal signals (such as PENDOWN) directly onto the GPIO pins. However, in this case the interrupt signals cannot be made sticky, and more GPIO pins are tied up both on the WM9713L and on the CPU.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
56h GPIO pins function select	2	GE2	1	GPIO2 / IRQ output select 0: Pin 45 disconnected from GPIO logic set 4Ch, bit 2 to '0' to output IRQ signal 1: Pin 45 connected to GPIO logic (IRQ disabled)
	3	GE3	1	GPIO3 / PENDOWN output select 0: Pin 46 disconnected from GPIO logic set 4Ch, bit 3 to '0' to output PENDOWN signal 1: Pin 46 connected to GPIO logic
	4	GE4	1	GPIO4 / ADA / MASK output select 0: Pin 47 disconnected from GPIO logic set 4Ch, bit 4 to '0' to output ADA signal set 4Ch, bit 4 to '1' to input MASK signal 1: Pin 47 connected to GPIO logic
	5	GE5	1	GPIO5 / SPDIF output select 0: Pin 48 = SPDIF (disconnected from GPIO logic) set 4Ch, bit 5 to '0' to output SPDIF signal 1: Pin 48 connected to GPIO logic (SPDIF disabled)
	6	GE6	1	GPIO6 / ADA / MASK output select 0: Pin 3 disconnected from GPIO logic set 4Ch, bit 6 to '0' to output ADA signal set 4Ch, bit 6 to '1' to input MASK signal 1: Pin 3 connected to GPIO logic

Table 62 Using GPIO Pins for Non-GPIO Functions

## POWER MANAGEMENT

### INTRODUCTION

The WM9713L includes the standard power down control register defined by the AC'97 specification (register 26h). Additionally, it also allows more specific control over the individual blocks of the device through register Powerdown registers 3Ch and 3Eh. Each particular circuit block is active when both the relevant bit in register 26h AND the relevant bit in the Powerdown registers 3Ch and 3Eh are set to '0'.

Note that the default power-up condition is all OFF.

### AC97 CONTROL REGISTER

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
26h Powerdown/ Status register	14	PR6	1 (OFF)	Disables all output PGAS
	13	PR5	1 (OFF)	Disables internal clock
	12	PR4	1 (OFF)	Disables AC-link interface (external clock off)
	11	PR3	1 (OFF)	Disables VREF, input PGAs, DACs, ADCs, mixers and outputs
	10	PR2	1 (OFF)	Disables input PGAs and mixers
	9	PR1	1 (OFF)	Disables stereo DAC
	8	PR0	1 (OFF)	Disables stereo ADCs and record mux PGA
	3	REF	0	Read-only bit, indicates VREF is ready (inverse of PR2)
	2	ANL	0	Read-only bit, indicates analogue mixers are ready (inverse of PR3)
	1	DAC	0	Read-only bit, indicates stereo DAC is ready (inverse of PR1)
	0	ADC	0	Read-only bit, indicates stereo ADC is ready (inverse of PR0)

Table 63 Powerdown and Status Register (Conforms to AC'97 Rev 2.2)

### EXTENDED POWERDOWN REGISTERS

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
3Ch Powerdown (1)	15	PADCPD	1 (OFF)	Disables touchpanel/aux ADC
	14	VMID1M	1 (OFF)	Disables 1Meg Vmid resistor string
	13	TSHUT	1 (OFF)	Disables thermal shutdown
	12	VXDAC	1 (OFF)	Disables VXDAC
	11	AUXDAC	1 (OFF)	Disables AUXDAC
	10	MBIAS	1 (OFF)	Disables master bias reference generator
	9	PLL	1 (OFF)	Disables PLL
	7	DACL	1 (OFF)	Disables left DAC (see Note 1)
	6	DACR	1 (OFF)	Disables right DAC (see Note 1)
	5	ADCL	1 (OFF)	Disables left ADC
	4	ADCR	1 (OFF)	Disables right ADC
	3	HPLX	1 (OFF)	Disables left headphone mixer
	2	HPRX	1 (OFF)	Disables right headphone mixer
	1	SPKX	1 (OFF)	Disables speaker mixer
	0	MX	1 (OFF)	Disables mono mixer
<b>Note:</b> When analogue inputs or outputs are disabled, they are internally connected to VREF through a large resistor ( $VREF=AVDD/2$ except when VREF and VMID1M are both OFF). This maintains the potential at that node and helps to eliminate pops when the pins are re-enabled.				

Table 64 Extended Power Down Register (1) (Additional to AC'97 Rev 2.2)

**Note:**

1. When disabling a PGA, always ensure that it is muted first.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
3Eh Powerdown (2)	15	MCD	1 (OFF)	Disables microphone current detect
	14	MICBIAS	1 (OFF)	Disables microphone bias
	13	MONO	1 (OFF)	Disables MONO output PGA (see Note 1)
	12	OUT4	1 (OFF)	Disables OUT4 output PGA ( " " )
	11	OUT3	1 (OFF)	Disables OUT3 output PGA ( " " )
	10	HPL	1 (OFF)	Disables HPL output PGA ( " " )
	9	HPR	1 (OFF)	Disables HPR output PGA ( " " )
	8	SPKL	1 (OFF)	Disables SPKL output PGA ( " " )
	7	SPKR	1 (OFF)	Disables SPKR output PGA ( " " )
	6	LL	1 (OFF)	Disables LINEL PGA ( " " )
	5	LR	1 (OFF)	Disables LINER PGA ( " " )
	4	MOIN	1 (OFF)	Disables MONOIN PGA ( " " )
	3	MA	1 (OFF)	Disables mic PGA MA ( " " )
	2	MB	1 (OFF)	Disables mic PGA MB ( " " )
	1	MPA	1 (OFF)	Disables mic pre-amp MPA
	0	MPB	1 (OFF)	Disables mic pre-amp MPB
<b>Note:</b> When analogue inputs or outputs are disabled, they are internally connected to VREF through a large resistor ( $V_{REF}=AVDD/2$ except when VREF and VMID1M are both OFF). This maintains the potential at that node and helps to eliminate pops when the pins are re-enabled.				

Table 65 Extended Power Down Register (2) (Additional to AC'97 Rev 2.2)

**Note:**

1. When disabling a PGA, always ensure that it is muted first.

**ADDITIONAL POWER MANAGEMENT**

Mixer output inverters: see "Mixer output Inverters" section. Inverters are OFF by default.

Touchpanel Interface: see "Controlling the Touchpanel Digitiser / Power Management". The touchpanel digitiser is OFF by default.

**SLEEP MODE**

Whenever the PR4 bit (reg. 26h) is set, the AC-Link interface is disabled, and the WM9713L is in sleep mode. There is in fact a very large number of different sleep modes, depending on the other control bits. For example, the low-power standby mode described below is a sleep mode. It is desirable to use sleep modes whenever possible, as this will save power. The following functions do not require a clock and can therefore operate in sleep mode:

- Analogue-to-analogue audio (DACs and ADCs unused), e.g. phone call mode
- Pen-down detection
- GPIO and interrupts
- Battery alarm / analogue comparators

The WM9713L can awake from sleep mode as a result of

- A warm reset on the AC-Link (according to the AC'97 specification)
- A signal on a GPIO pin (if the pin is configured as an input, with wake-up enabled – see "GPIO and Interrupt Control" section)
- A virtual GPIO event such as pen-down, battery alarm, etc. (see "GPIO and Interrupt Control" section)

### LOW POWER STANDBY MODE

If all the bits in registers 26h, 3Ch and 3Eh are set except VMID1M (register 3Ch, bit 14), then the WM9713L is in low-power standby mode and consumes very little current. A 1M $\Omega$  resistor string remains connected across AVDD to generate VREF. This is necessary if the on-chip analogue comparators are used (see “Battery Alarm and Battery Measurement” section), and helps shorten the delay between wake-up and playback readiness. If VREF is not required, the 1M $\Omega$  resistor string can be disabled by setting the VMID1M bit, reducing current consumption further.

### SAVING POWER AT LOW SUPPLY VOLTAGES

The analogue supplies to the WM9713L can run from 1.8V to 3.6V. By default, all analogue circuitry on the IC is optimized to run at 3.3V. This set-up is also good for all other supply voltages down to 1.8V. However, at lower voltages, it is possible to save power by reducing the internal bias currents used in the analogue circuitry. This is controlled as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
5Ch	6:5	VBIAS	00	Analogue Bias optimization 11 : Lowest bias current, optimized for 1.8V 10 : Low bias current, optimized for 2.5V 01, 00 : Default bias current, optimized for 3.3V

Table 66 Analogue Bias Selection

### POWER ON RESET (POR)

The WM9713L has an internal power on reset (PORB) which ensures that a reset is applied to all registers until a supply threshold has been exceeded. The POR circuitry monitors the voltage for both AVDD and DCVDD and will release the internal reset signal once these supplies are both nominally greater than 1.36V. The internal reset signal is an AND of the PORB and RESETB input signal.

It is recommended that for operation of the WM9713L, all device power rails should be stable before configuring the device for operation.

### AC97 INTERFACE TIMING

#### Test Characteristics:

DBVDD = 3.3V, DCVDD = 3.3V, DGND1 = DGND2 = 0V, T<sub>A</sub> = -25°C to +85°C, unless otherwise stated.

#### CLOCK SPECIFICATIONS

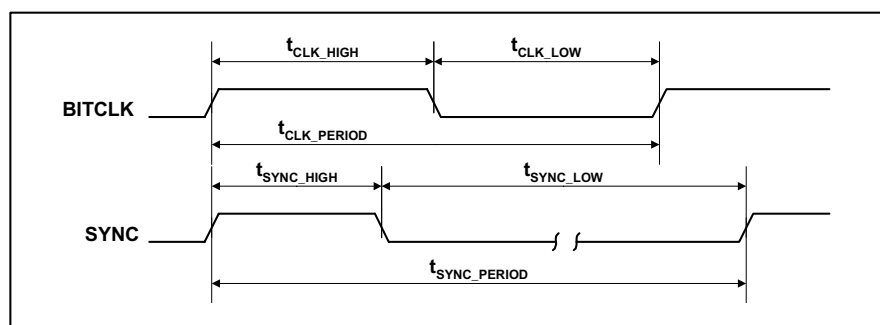

Figure 28 Clock Specifications (50pF External Load)

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
BITCLK frequency			12.288		MHz
BITCLK period	t <sub>CLK_PERIOD</sub>		81.4		ns
BITCLK output jitter				750	ps
BITCLK high pulse width (Note 1)	t <sub>CLK_HIGH</sub>	36	40.7	45	ns
BITCLK low pulse width (Note 1)	t <sub>CLK_LOW</sub>	36	40.7	45	ns
SYNC frequency			48		kHz
SYNC period	t <sub>SYNC_PERIOD</sub>		20.8		μs
SYNC high pulse width	t <sub>SYNC_HIGH</sub>		1.3		μs
SYNC low pulse width	t <sub>SYNC_LOW</sub>		19.5		μs

**Note:**

1. Worst case duty cycle restricted to 45/55

## DATA SETUP AND HOLD

Figure 29 Data Setup and Hold (50pF External Load)

## Note:

Setup and hold times for SDATAIN are with respect to the AC'97 controller, not the WM9713L.

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
Setup to falling edge of BITCLK	$t_{\text{SETUP}}$	10			ns
Hold from falling edge of BITCLK	$t_{\text{HOLD}}$	10			ns
Output valid delay from rising edge of BITCLK	$t_{\text{CO}}$			15	ns

## SIGNAL RISE AND FALL TIMES

Figure 30 Signal Rise and Fall Times (50pF External Load)

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
BITCLK rise time	$t_{\text{rise\_CLK}}$	2		6	ns
BITCLK fall time	$t_{\text{fall\_CLK}}$	2		6	ns
SYNC rise time	$t_{\text{rise\_SYNC}}$	2		6	ns
SYNC fall time	$t_{\text{fall\_SYNC}}$	2		6	ns
SDATAIN rise time	$t_{\text{rise\_DIN}}$	2		6	ns
SDATAIN fall time	$t_{\text{fall\_DIN}}$	2		6	ns
SDATAOUT rise time	$t_{\text{rise\_DOUT}}$	2		6	ns
SDATAOUT fall time	$t_{\text{fall\_DOUT}}$	2		6	ns

**AC-LINK POWERDOWN****Figure 31 AC-Link Powerdown Timing**

AC-Link powerdown occurs when PR4 (register 26h, bit 12) is set (see "Power Management" section).

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
End of Slot 2 to BITCLK and SDATAIN low	$t_{S2\_PDOWN}$			1.0	$\mu s$

**COLD RESET (ASYNCHRONOUS, RESETS REGISTER SETTINGS)****Figure 32 Cold Reset Timing****Note:**

For correct operation SDATAOUT and SYNC must be held LOW for entire RESETB active low period otherwise the device may enter test mode. See AC'97 specification or Wolfson applications note WAN104 for more details.

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
RESETB active low pulse width	$t_{RST\_LOW}$	1.0			$\mu s$
RESETB inactive to BITCLK startup delay	$t_{RST2CLK}$	162.8			ns

**WARM RESET (ASYNCHRONOUS, PRESERVES REGISTER SETTINGS)****Figure 33 Warm Reset Timing**

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
SYNC active high pulse width	$t_{\text{SYNC\_HIGH}}$		1.3		$\mu\text{s}$
SYNC inactive to BITCLK startup delay	$t_{\text{RST2CLK}}$	162.4			ns

## REGISTER BITS BY ADDRESS

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
00h	14:10	SE [4:0]	11000	Indicates a codec from Wolfson Microelectronics	Intel's AC'97 Component Specification, Revision 2.2, page 50
	9:6	ID9:6	0101	Indicates 18 bits resolution for ADCs and DACs	
	5	ID5	1	Indicates that the WM9713L supports bass boost	
	4	ID4	1	Indicates that the WM9713L has a headphone output	
	3	ID3	0	Indicates that the WM9713L does not support simulated stereo	
	2	ID2	1	Indicates that the WM9713L supports bass and treble control	
	1	ID1	0	Indicates that the WM9713L does not support modem functions	
	0	ID0	0	Indicates that the WM9713L does not have a dedicated microphone ADC	

**Register 00h** is a read-only register. Writing any value to this register resets all registers to their default, but does not change the contents of reg. 00h. Reading the register reveals information about the codec to the driver, as required by the AC'97 Specification, Revision 2.2

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
02h	15	MUL	1 (mute)	Mutes SPKL	Analogue Audio Outputs
	14	ZCL	0 (OFF)	Enables zero-cross detector on SPKL	
	13:8	SPKLVOL	000000 (0dB)	SPKL volume	
	7	MUR	1 (mute)	Mutes SPKR	
	7	ZCR	0 (OFF)	Enables zero-cross detector on SPKR	
	5:0	SPKRVOL	000000 (0dB)	SPKR volume	

**Register 02h** controls the output pins SPKL and SPKR.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
04h	15	MUL	1 (mute)	Mutes HPL	Analogue Audio Outputs
	14	ZCL	0 (OFF)	Enables zero-cross detector on HPL

	1	OUT3	0 (Off)	Enables fast power for OUT3 output	
	0	OUT4	0 (Off)	Enables fast power for OUT4 output	

**Register 42h** controls power-up conditions for output PGAs.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
44h	14:12	S <sub>EXT</sub> [6:4]	000 (div 1)	Defines clock division ratio for Hi-fi block: 000=f; 001=f/2; ... ; 111=f/8	Clock Generation
	11:8	S <sub>EXT</sub> [3:0]	0000 (div 1)	Defines clock division ratio for PCM interface and voice DAC: 0000=f; 0001=f/1; ... ; 1111=f/16	
	7	CLKSRC	1 (ext clk)	Selects between PLL clock and External clock	
	5:3	PENDIV	000 (div 16)	Sets PENADC clock divisor: 000=f/16; 001=f/12; 010=f/8; 011=f/6; 100=f/4; 101=f/3; 110=f/2; 111=f	
	2	CLKBX2	0 (Off)	Clock doubler for MCLKB	
	1	CLKAX2	0 (Off)	Clock doubler for MCLKA	
	0	CLKMUX	0 (MCLKA)	Selects between MCLKA and MCLKB (N.B. On power-up clock must be present on MCLKA and must be active for 2 clock cycles after switching to MCLKB)	

**Register 44h** controls clock division and muxing.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
46h	15:12	N[3:0]	0000	PLL integer division control (must be set between 5-12 for integer N mode)	Analogue Audio Outputs, Power-Up
	11	LF	0 = off	Allows PLL operation with low frequency input clocks (< 8.192MHz)	
	10	SDM	0	Sigma Delta Modulator enable. Allows fractional N division	
	9	DIVSEL	0 = off	Enables input clock to PLL to be divided by 2 or 4. Use if input clock is above 14.4MHz	
	8	DIVCTL	0	Controls division mode when DIVSEL is high. 0 = div by 2, 1 = div by 4.	
	6:4	PGADDR	000	Pager address bits to access programming of K[21:0] and S <sub>PLL</sub> [7:0]	
	3:0	PGDATA	0000	Pager data bits	

**Register 46h** controls PLL clock generation.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
4Ch		please refer to the register map	all 1 (all inputs) except unused bits	Controls GPIO configuration as inputs or as outputs (note: virtual GPIOs can only be inputs)	GPIO and Interrupt Control
4Eh			all 1	Controls GPIO polarity (actual polarity depends on register 4Ch AND register 4Eh)	
50h			all 0 (not sticky)	Makes GPIO signals sticky	
52h			all 0 (OFF)	Enables wake-up for each GPIO signal	
54h			= status of GPIO inputs	GPIO pin status (read from inputs, write '0' to clear sticky bits)	
				Controls Comparator 1 signal (virtual GPIO)	
				Controls Comparator 2 signal (virtual GPIO)	
				Controls Pen-Down Detector signal (virtual GPIO)	
				Controls ADA signal (virtual GPIO)	
				Controls Thermal sensor signal (virtual GPIO)	
				Controls Microphone short detect (virtual GPIO)	
				Controls Microphone insert detect (virtual GPIO)	
				Controls GPIO8 (pin 3)	
				Controls GPIO7 (pin 11)	
				Controls GPIO6 (pin 12)	
				Controls GPIO5 (pin 48)	
				Controls GPIO4 (pin 47)	
				Controls GPIO3 (pin 46)	
				Controls GPIO2 (pin 45)	
				Controls GPIO1 (pin 44)	

Register 4Ch to 54h control the GPIO pins and virtual GPIO signals.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION	REFER TO
56h	8	GE8	1 (GPIO)	Selects between GPIO8 and SPDIF_OUT function for pin 12	GPIO and Interrupt Control

7Eh	15:8	T7:0	4Ch	ASCII character "L"	
	7:0	REV7:0	12h	12 for WM9713L	

Register 7Ch and 7Eh are read-only registers that indicate to the driver that the codec is a WM9713L.

## APPLICATIONS INFORMATION

### RECOMMENDED EXTERNAL COMPONENTS

Recommended External Component Diagram -TBA

### LINE OUTPUT

The headphone outputs, HPL and HPR, can be used as stereo line outputs. The speaker outputs, SPKL and SPKR, can also be used as line outputs. Recommended external components are shown below.

**Figure 34 Recommended Circuit for Line Output**

The DC blocking capacitors and the load resistance together determine the lower cut-off frequency,  $f_c$ . Assuming a 10 k $\Omega$  load and  $C_1, C_2 = 10\mu\text{F}$ :

$$f_c = 1 / 2\pi (R_L + R_1) C_1 = 1 / (2\pi \times 10.1\text{k}\Omega \times 1\mu\text{F}) = 16 \text{ Hz}$$

Increasing the capacitance lowers  $f_c$ , improving the bass response. Smaller values of  $C_1$  and  $C_2$  will diminish the bass response. The function of  $R_1$  and  $R_2$  is to protect the line outputs from damage when used improperly.

## AC-COUPLED HEADPHONE OUTPUT

The circuit diagram below shows how to connect a stereo headphone to the WM9713L.

**Figure 35 Simple Headphone Output Circuit Diagram**

The DC blocking capacitors C1 and C2 together with the load resistance determine the lower cut-off frequency,  $f_c$ . Increasing the capacitance lowers  $f_c$ , improving the bass response. Smaller capacitance values will diminish the bass response. For example, with a  $16\Omega$  load and  $C_1 = 220\mu\text{F}$ :

$$f_c = 1 / 2\pi R_L C_1 = 1 / (2\pi \times 16\Omega \times 220\mu\text{F}) = 45 \text{ Hz}$$

## DC COUPLED (CAPLESS) HEADPHONE OUTPUT

In the interest of saving board space and cost, it may be desirable to eliminate the  $220\mu\text{F}$  DC blocking capacitors. This can be achieved by using OUT3 as a headphone pseudo-ground, as shown below.

**Figure 36 Capless Headphone Output Circuit Diagram**

As the OUT3 pin produces a DC voltage of  $AVDD/2$ , there is no DC offset between HPL/HPR and OUT3, and therefore no DC blocking capacitors are required. However, this configuration has some drawbacks:

The power consumption of the WM9713L is increased, due to the additional power consumed in the OUT3 output buffer.

If the DC coupled output is connected to the line-in of a grounded piece of equipment, then OUT3 becomes short-circuited. Although the built-in short circuit protection will prevent any damage to the WM9713L, the audio signal will not be transmitted properly.

OUT3 cannot be used for another purpose

## BTL LOUDSPEAKER OUTPUT

SPKL and SPKR can differentially drive a mono 8Ω loudspeaker as shown below.

**Figure 37 Speaker Output Connection (INV = 1)**

To drive out differentially one of the speaker outputs must be inverted using INV1 or INV2.

## COMBINED HEADSET / BTL EAR SPEAKER

In smartphone applications with a loudspeaker and separate ear speaker (receiver), a BTL ear speaker can be connected at the OUT3 pin, as shown below.

**Figure 38 Combined Headset / BTL Ear Speaker**

The ear speaker and the headset play the same signal. Whenever the headset is plugged in, the headphone outputs are enabled and OUT3 disabled. When the headset is not plugged in, OUT3 is enabled (see “Jack Insertion and Auto-Switching”)

## COMBINED HEADSET / SINGLE-ENDED EAR SPEAKER

Instead of a BTL ear speaker, a single-ended ear speaker can also be used, as shown below.

Figure 39 Combined Headset / Single-ended Ear Speaker

## JACK INSERT DETECTION

The circuit diagram below shows how to detect when a headphone or headset has been plugged into the headphone socket. It generates an interrupt, instructing the controller to enable HPL and HPR and disable OUT3.

Figure 40 Jack Insert Detection Circuit

The circuit requires a headphone socket with a switch that closes on insertion. It detects both headphones and phone headsets. Any GPIO pin can be used, provided that it is configured as an input.

## HOOKSWITCH DETECTION

Alternatively a headphone socket with a switch that opens on insertion can be used. For this mode of operation the GPIO input must be inverted.

The circuit diagram below shows how to detect when the "hookswitch" of a phone headset is pressed (pressing the hookswitch is equivalent to lifting the receiver in a stationary telephone).

**Figure 41 Hookswitch Detection Circuit**

The circuit uses a GPIO pin as a sense input. The impedance of the microphone and the resistor in the MICBIAS path must be such that the potential at the GPIO pin is above  $0.7 \times \text{DBVDD}$  when the hookswitch is open, and below  $0.3 \times \text{DBVDD}$  when it is closed.

## TYPICAL OUTPUT CONFIGURATIONS

The WM9713L has three outputs capable of driving loads down to  $16\Omega$  (headphone / line drivers) – HPL, HPR and MONO - and four output capable of driving loads down to  $8\Omega$  (loudspeaker / line drivers) – SPKL, SPKR, OUT3 and OUT4. The combination of output drivers, mixers and mixer inverters means that many output configurations can be supported. Below are some examples of typical output configurations for smartphone applications.

### STEREO SPEAKER

Figure 42 shows a typical output configuration for stereo speakers with headphones, ear speaker and hands-free operation. The table shows suggested mixer outputs to select for each output PGA for a given operating scenario. (Note the inverted mixer outputs can be achieved using the mixer output inverters INV1 and INV2).

Config/ Driver	Hands-free (1:mmix)	Hands-free (2:spkmix)	Ear Speaker (1:mmix)	Ear Speaker (2:hpmix)	Ear Speaker (1) + Speaker	Ear Speaker (2) + Speaker	Stereo Speaker	Headphone
mono	mmix	spkmix	mmix	-hpmixR	mmix	-hpmixR	-	$Z_H$
spkl	-	-	-	-	hpmixL	hpmixL	hpmixL	$(Z_H)$
spkr	-	-	-	-	hpmixR	hpmixR	hpmixR	-
hpl	$Z_H$	$Z_H$	$V_{mid}$	hpmixL	$V_{mid}$	hpmixL	-	hpmixL
hpr	-	-	-	-	-	-	-	hpmixR
out3	-	-	-	-	-hpmixR	-hpmixR	-hpmixR	-
out4	-	-	-	-	-hpmixL	-hpmixL	-hpmixL	$(V_{mid})$

Figure 42 Stereo Speaker Output Configuration

### MONO SPEAKER

Figure 43 shows a typical output configuration for mono speaker with headphones, ear speaker and hands-free operation. The table shows suggested mixer outputs to select for each output PGA for a given operating scenario. (Note the inverted mixer outputs can be achieved using the mixer output inverters INV1 and INV2).

Config/ Driver	Hands-free (1:mmix)	Hands-free (2:spkmix)	Ear Speaker (1:mmix)	Ear Speaker (2:hpmix)	Ear Speaker (1) + Speaker	Ear Speaker (2) + Speaker	Mono Speaker	Headphone

spkl	-	-	-	-	hpmixL	hpmixL	spkmix	(Z <sub>h</sub> )
spkr	-	-	mmix	hpmixR	mmix	hpmixR	-	-
hpl	-	-	-	-	-	-	-	hpmixL
hpr	-	-	-	-	-	-	-	hpmixR
out3	-	-	-mmix	-hpmixL	-mmix	-hpmixL	-	-
out4	-	-	-	-	-hpmixR	-hpmixR	-spkmix	(V <sub>mia</sub> )

Figure 43 Mono Speaker Output Configuration

**WM9713L MONO SPEAKER**

Figure 44 shows a typical output configuration compatible with the WM9712 for mono speaker with headphones, ear speaker and hands-free operation. The table shows suggested mixer outputs to select for each output PGA for a given operating scenario. (Note the inverted mixer outputs can be achieved using the mixer output inverters INV1 and INV2).

When using this configuration note that AVDD, HPVDD and SPKVDD must all be at the same voltage to achieve the best performance.

Config/ Driver	Hands-free (1:mmix)	Hands-free (2:spkmix)	Ear Speaker (1:mmix)	Ear Speaker (2:hpmix)	Ear Speaker (1) + Speaker	Ear Speaker (2) + Speaker	Mono Speaker	Headphone

## NOTES:

1. DIMENSION b APPLIED TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15 mm AND 0.30 mm FROM TERMINAL TIP.
2. ALL DIMENSIONS ARE IN MILLIMETRES
3. THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JESD 95-1 SPP-002.
4. COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
5. THIS DRAWING IS SUBJECT TO CHANGE WITHOUT NOTICE.

## IMPORTANT NOTICE

Wolfson Microelectronics plc (WM) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current. All products are sold subject to the WM terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

WM warrants performance of its products to the specifications applicable at the time of sale in accordance with WM's standard warranty. Testing and other quality control techniques are utilised to the extent WM deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

In order to minimise risks associated with customer applications, adequate design and operating safeguards must be used by the customer to minimise inherent or procedural hazards. Wolfson products are not authorised for use as critical components in life support devices or systems without the express written approval of an officer of the company. Life support devices or systems are devices or systems that are intended for surgical implant into the body, or support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided, can be reasonably expected to result in a significant injury to the user. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

WM assumes no liability for applications assistance or customer product design. WM does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of WM covering or relating to any combination, machine, or process in which such products or services might be or are used. WM's publication of information regarding any third party's products or services does not constitute WM's approval, license, warranty or endorsement thereof.

Reproduction of information from the WM web site or datasheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations and notices. Representation or reproduction of this information with alteration voids all warranties provided for an associated WM product or service, is an unfair and deceptive business practice, and WM is not responsible nor liable for any such use.

Resale of WM's products or services with statements different from or beyond the parameters stated by WM for that product or service voids all express and any implied warranties for the associated WM product or service, is an unfair and deceptive business practice, and WM is not responsible nor liable for any such use.
